A comparison between local and spinal anesthesia in inguinal hernia repair

Protocol summary

Summary

The aim of this randomized clinical trial is to compare the local and spinal Anesthesia complication in inguinal Hernia Repair. A total of 60 patients, meeting eligibility criteria, will be randomly allocated into two equal groups. 30 patients were put into LA group who received local anesthesia, and 30 patients were put into SA group who received Spinal anesthesia. Lichtenstein hernia repair technique will be used for all patients. After establishing routine monitors, 5 cc/kg ringer lactate will be infused for all patients. Local anesthesia will be applied through 10 ml 1.5% lidocaine, 30 ml 0.5% bupivacain and 2 ml 1:200,000 epinephrine mixture. Spinal anesthesia will be performed with 8 mg bupivacain. Anesthesia will be performed on all patients by one anesthesiologist and also, all surgery procedures will be performed by one surgeon. The duration of surgery, type of hernia, urinary retention, hematoma in the area of operation, surgical site infection, pain intensity, analgesic consumption in the first 24 hours after surgery and postoperative length of stay for all patients will be recorded. Patients pain intensity at the 0, 3, 6, 12 and 24 hours after surgery will be recorded by Visual Analogue Scale. Also, patients will have a physical exam at the end of the first week.

Scientific title

A comparison between local and spinal anesthesia in inguinal hernia repair

Public title

Inguinal hernia repair with local anesthesia

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: Informed written consent; Age between 18 - 70 years; Elective inguinal hernia. Exclusion criteria: Recurrent hernia; Incarcerated hernia; Hydrocele; Femoral hernia; Bilateral hernia; Pregnancy; Sensitivity to local anesthetic drugs; Diabetes mellitus;

Coagulopathy disorder; substance abuse.

Age

From **18 years** old to **70 years** old

Gender

Both

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **60**

Health conditions studied

1

Description of health condition studied

Local anesthesia

ICD-10 code

t88.9

ICD-10 code description

Complication of surgical and medical care, unspecified

Primary outcomes

1

Description

Intensity of postoperative pain

Timepoint

At the end of surgery and 3, 6, 12 and 24 hours after
surgery

Method of measurement

Visual Analogue Scale

Secondary outcomes

1

Description

Duration of surgery

Timepoint

During surgery

Method of measurement

Questionnaire

2

Description

Urinary retention

Timepoint

After surgery

Method of measurement

Questionnaire

3

Description

Hematoma in the area of operation

Timepoint

After surgery and at the end of the first week

Method of measurement

Questionnaire

4

Description

Surgical site infection

Timepoint

At the end of the first week

Method of measurement

Questionnaire

5

Description

postoperative length of stay

Timepoint

After surgery

Method of measurement

Questionnaire

6

Description

Analgesic consumption in the first 24 hours after surgery

Timepoint

In the first 24 hours after surgery

Method of measurement

Questionnaire

Intervention groups**1****Description**

For inguinal hernia repair in control group, spinal anesthesia will be performed with 8 mg bupivacain.

Category

Treatment - Other

2**Description**

For inguinal hernia repair in intervention group, local anesthesia will be applied through 10 ml 1.5% lidocaine, 30 ml 0.5% bupivacain and 2 ml 1:200,000 epinephrine mixture.
