

Clinical Trial Protocol

Iranian Registry of Clinical Trials

06 Jul 2026

Comparison of the effectiveness of Transcranial Direct Current Stimulation (tDCS), Acceptance and Commitment Therapy (ACT) and their combined effect on negative emotion, impulsiveness, perceived stress, cortisol, and estrogen levels in patients with migraine headache

Protocol summary

Study aim

Comparison of the effectiveness of tDCS, ACT, and their combined effect on reducing negative emotion, impulsiveness, perceived stress, blood cortisol levels, and increasing estrogen levels in patients with migraine headaches.

Design

Clinical trial with a control group, with parallel groups, one-sided blind, randomized, zero phase on 96 patients. Lottery was used for randomization.

Settings and conduct

Questionnaires and blood test results were taken from the subjects and randomly assigned in the experimental and control groups. The intervention of the tDCS group was conducted in the neurology clinic, by a professional tDCS performer, in 10 sessions (20 minutes), and the intervention of the ACT group was conducted in a group and online in 8 sessions of 60 minutes on the Skype application. The combined intervention was held both in person and online as mentioned. The control group did not receive any intervention. After the end of the interventions, the post-test (blood test and scales) was taken. For follow-up, blood tests and the scales were also done three months after the end of the interventions. During the whole period of the intervention, the subjects were blinded to the way of distribution in the groups, assumptions and possible results of the interventions.

Participants/Inclusion and exclusion criteria

Taking confirmed diagnosis of migraine, signing the written consent, Proficiency in Persian language, having access to the Internet and the Skype software (for groups taking the ACT course), being between the ages of 20 and 40, having no other effective physical or psychological conditions, and not undergoing drug and other treatments

Intervention groups

The tDCS group, the ACT group, the combination group of tDCS and ACT, and the control group

Main outcome variables

negative emotion, impulsiveness, perceived stress, blood cortisol, and estrogen levels

Scientific title

Comparison of the effectiveness of Transcranial Direct Current Stimulation (tDCS), Acceptance and Commitment Therapy (ACT) and their combined effect on negative emotion, impulsiveness, perceived stress, cortisol, and estrogen levels in patients with migraine headache

Public title

Comparison of the effectiveness of tDCS, ACT and their combined effect on negative emotion, impulsiveness, perceived stress, cortisol, and estrogen levels in patients with migraine

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Taking confirmed diagnosis of migraine, signing the written consent, Proficiency in Persian language, having access to the Internet and the Skype software (for groups taking the ACT course), being between the ages of 20 and 40, having no other effective physical or psychological conditions, and not undergoing drug and other treatments

Exclusion criteria:

Receiving another treatment during the intervention, having a history of a serious medical or neurological disorder (for participants who received tDCS), such as multiple sclerosis, brain injury or tumors, Parkinson's disease, seizures, dementia, brain stroke or any kind of heart disease, Huntington's chorea, having cardiac pacemaker, having any metal objects in or near the head, and implanted medication pumps which would increase the risk of tDCS

Age

From **20 years** old to **40 years** old

Gender

Female

Phase

N/A

Groups that have been masked

Sample size

Target sample size: **120**

Actual sample size reached: **96**

Randomization (investigator's opinion)

Randomized

Randomization description

Random assignment of patients to intervention and control groups was done by lottery. For this purpose, we write the names of all the people on small pieces of paper and put them in a container. We also prepare 4 different sheets with the names of 4 intervention and

control groups. First, we open the sheet of the first intervention group and write the names of the first 30 subjects that come out of the container. For other groups, we continue until the end (30 people in the second intervention group, 30 people in the third intervention group, and 30 people in the control group).

Blinding (investigator's opinion)

Single blinded

Blinding description

All participants were blinded to the way of distribution in groups, possible and expected results, and research assumptions, and no information about this was provided to them.

Health conditions studied**1****Description of health condition studied**

Migraine headaches

ICD-10 code**ICD-10 code description****Primary outcomes****1****Description**

Negative emotion, impulsiveness, perceived stress, blood cortisol and estrogen levels

Timepoint

Before the start of the intervention, after the end of the

intervention and three months after the end of the intervention

Method of measurement

Positive and negative affect scale (PANAS), Barratt impulsiveness scale (BIS), Perceived stress scale (PSS), Blood test to measure cortisol and estrogen levels.

Secondary outcomes

empty

Intervention groups

1

Description

The first intervention group, Transcranial Direct Current Stimulation (tDCS): The brain regions were localized using the EEG 10/20 system, and the anode and the cathode were located over the left and the right dorsolateral prefrontal cortex or DLPFC (F3 and F4), respectively. A current intensity of 2 mA for 20 min (30 s ramping up and 30 s ramping down at the start and end of stimulation) was used for 10 consecutive sessions (5 days per week). Direct current was transferred through a saline-soaked (0.9% NaCl) pair of surface sponge electrodes (size 5 cm x 5 cm=25 cm² each) and powered by a battery-driven stimulator authorized for human use (NeuroStim 2, Medina Teb, Iran).

Category

Treatment - Devices

2

Description

The second intervention group, Acceptance and Commitment Therapy (ACT): Vowles, Wetherell, and Sorrell ACT protocol was used, in which the subjects participated in 8 online sessions of ACT (on Skype), one-hour session per week. In this protocol, after introducing people and getting to know the generalities of the course, we worked on recognizing and accepting unpleasant personal events and painful experiences and being aware of hidden consequences, discovering and contacting them, changing language concepts, teaching relaxation, explaining the concept of role and context, observing self without judgment, explaining the concept of values, goals, and needs, creating motivation for change, training to practice and reviewing the tasks.

Category

Treatment - Devices

3

Description

The third intervention group, the combination of Transcranial Direct Current Stimulation (tDCS) and Acceptance and Commitment Therapy (ACT): This intervention was performed as described in the intervention of the first and second groups.

Category

Treatment - Devices

4

Description

Control group: This group did not receive any intervention during the research. However, to comply with the principle of fairness, all control group participants were allowed to take one of the interventions after the end of the research (tDCS or ACT).
