

Clinical Trial Protocol

Iranian Registry of Clinical Trials

10 Jun 2026

Comparison of ultrasound guided injection of hyaluronic acid, hyaluronidase enzyme and triamcinolone in the treatment of frozen shoulder

Protocol summary

Study aim

The aim of this study is comparing of the effectiveness of intra-articular injections of hyaluronic acid, hyalase and corticosteroids in reducing pain, improving function, shoulder range of motion, and the level of treatment's satisfaction in patients with frozen shoulder.

Design

A controlled, parallel-group, double blind, randomized, phase 3 clinical trial on 90 patients. Random allocation software is used for randomization.

Settings and conduct

Subjects, interventionist, outcome assessor, statistician and the researcher are all blind to treatment groups allocation; using pre-filled syringes and sealed envelopes. Subjects will be randomly allocated in 3 groups. The study will take place in Modarres hospital, Tehran.

Participants/Inclusion and exclusion criteria

Inclusion criteria include: people aged 25 to 70 years who have been diagnosed with adhesive capsulitis and have not responded to conservative treatments and have scored 5 or higher based on pain intensity scale (VAS) and less than 6 months from the onset of symptoms .Exclusion criteria : History of shoulder trauma in the last 6 months; history of humerus fracture or tearing of rotator cuff muscles; pregnancy and breastfeeding; history of shoulder surgery and inflammatory systemic diseases

Intervention groups

Intervention group1: includes 30 patients who are treated with Hyalase injection, 1500 units in 5 cc of normal saline along with 2 cc of 2% lidocaine.
Intervention group 2: includes 30 patients who are treated with 2.5 cc of hyaluronic acid with 2.5 cc of normal saline and 2 cc of lidocaine. Control group: includes 30 patients who are treated with injection of 40 mg of triamcinolone along with 4 cc of normal saline and

2 cc of 2% lidocaine.

Main outcome variables

Active range of motion of shoulder, assessment of shoulder pain, assessment of patient's performance in daily tasks and degree of patient's satisfaction.

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

People aged 25 to 70 years have been diagnosed with adhesive capsulitis based on history and physical examination and did not respond to conservative treatments including non-steroidal pain relievers, exercise therapy and physical modalities. According to VAS criteria, they have scored 5 or higher. More than 30 degrees restriction of shoulder active range of motion in at least 2 of 4 directions of motion (abduction, flexion, external rotation and internal rotation) compared to the range of motion of the healthy shoulder (opposite side). Less than 6 months have passed since the onset of symptoms.

Exclusion criteria:

History of shoulder trauma in the last 6 months History of humerus bone fracture, supraspinatus tear, subacromial bursitis, calcific tendonitis and acromioclavicular joint osteoarthritis Pregnancy and breastfeeding. The presence of nerve injury or the presence of neurological disorders that cause dysfunction of the upper limbs, including brachial plexus plexopathy, hemiplegia and peripheral nerve injury Known allergy or sensitivity to hyalase, hyaluronic acid, or corticosteroids Psychological problems History of shoulder surgery A patient who is unable to cooperate to check the range of motion due to severe pain History of shoulder intra-articular injection of corticosteroids and hyaluronic acid in the last 6 months Inflammatory systemic diseases, hypothyroidism, hyperthyroidism and diabetes Use of anticoagulants

Randomization (investigator's opinion)

Randomized

Randomization description

In this clinical trial study, 90 patients diagnosed with frozen shoulder will be randomly enrolled. Block randomization method will be used for random allocation of people in the studied groups. In this method, blocks of 9 will be used with a ratio of 1:1:1. Random Allocation software will be used to generate random sequences. For concealment, random allocation concealment method will be used, which is marked with the letters A (Hyalase receiving group), B (Triamcinolone receiving group) and C (Hyaluronic acid receiving group) and recorded on cards. These cards will be placed in the sealed envelopes in order. In order to maintain the created sequence, numbering will be done on the outer surface of the envelopes. Finally, the numbered envelopes will be placed in a folder. Then based on The order of entry of the eligible participants, the envelopes will be opened and the assigned group of that participant will be known.

Blinding (investigator's opinion)

Double blinded

Blinding description

The researcher, patients and the collaborator of the project who will perform the statistical analysis will not be aware of the study . grouping of patients will be noted and will be shared to one of the partners

Health conditions studied

1

Description of health condition studied

Adhesive capsulitis or Frozen shoulder

ICD-10 code

M75.0

ICD-10 code description

Adhesive capsulitis of shoulder

Primary outcomes

1

Description

Active range of motion of shoulder

Timepoint

At the beginning of the study (before intervention) and 8 weeks and 24 weeks after the intervention

Method of measurement

Digital goniometer

2

Description

Assessment of shoulder pain

Timepoint

At the beginning of the study (before intervention) and 8 weeks and 24 weeks after the intervention

Method of measurement

Visual analogue scale (VAS)

3

Description

Assessment of the patient's performance in daily tasks

Timepoint

At the beginning of the study (before intervention) and 8 weeks and 24 weeks after the intervention

Method of measurement

Oxford Shoulder Score (OSS)

Secondary outcomes

1

Description

The degree of patient's satisfaction with the treatment

Timepoint

At the beginning of the study (before intervention) and 8 weeks and 24 weeks after the intervention

Method of measurement

5-items questionnaire

Intervention groups

1

Description

Intervention group: Includes 30 patients who are treated with hyalase injection at the rate of 1500 units in 5 cc of

normal saline along with 2 cc of 2% lidocaine.

Category

Treatment - Drugs

2

Description

Intervention group: Includes 30 patients who are treated with triamcinolone injection in the amount of 40 mg (one cc) along with 4 cc of normal saline and 2 cc of 2% lidocaine.

Category

Treatment - Drugs

3

Description

Intervention group: Including 30 patients who are treated with 2.5 cc of hyaluronic acid (20 mg per cc) along with 2.5 cc of normal saline and 2 cc of lidocaine

Category

Treatment - Drugs

Title and more details about the data/document

All the data of people participating in this study can be shared after deidentifying people

When the data will become available and for how long

The access period starts one year after the results are published

To whom data/document is available

Data of this study will be available to researchers working in academic and scientific institutions

Under which criteria data/document could be used

If the goal of the researchers is to conduct a systematic review and meta-analysis on the data, the non-identifiable data of the patients will be provided to the researchers.

From where data/document is obtainable

By sending an email to alin7093@gmail.com

What processes are involved for a request to access data/document

Sending an e-mail and explaining the purpose and how to use the data
