

Clinical Trial Protocol

Iranian Registry of Clinical Trials

16 Sep 2026

Investigating the effect of implementing a management protocol of patient-ventilator asynchrony on the clinical outcomes of patients admitted to ICU

Protocol summary

Study aim

Determining the impact of the implementation of the management protocol of inconsistency between the patient and the ventilator on the clinical outcomes of patients admitted to the ICU

Design

A clinical trial with a control group with parallel, one-sided blind, randomized groups on 60 patients was used for randomization using the random permutation block method, spss software

Settings and conduct

This study is a randomized clinical trial and is conducted in the Mega ICU1 department of Golestan Ahvaz Hospital. The sample size is 60 people who will be divided into two intervention and control groups by random number table. The study is one-sided blind

Participants/Inclusion and exclusion criteria

- Age range between 15 and 65 years
- Patients who are under mechanical ventilation with a ventilator.
- No more than 3 days have passed since the patient was admitted to the ICU.
- Informed consent from the legal guardian for the patient's participation in the study
- Apache 2 score between 30 and 50
- Having a spontaneous breathing effort in addition to the forced breaths of the ventilator (the patient is on assisted-controlled or spontaneous modes)

Intervention groups

Patients are divided into two groups, an intervention group and a control group. In the intervention group, the protocol is executed for 60 seconds until the lack of synchronization between the patient and the device is resolved. This cycle continues. The control group received routine care

Main outcome variables

The duration of connection to the ventilator, asynchrony between the patient and the device, the rate of death of the patient, spontaneous extubation of the patient

Scientific title	Investigating the effect of implementing a management protocol of patient-ventilator asynchrony on the clinical outcomes of patients admitted to ICU
Public title	pva review
Purpose	Supportive
Inclusion/Exclusion criteria	
Inclusion criteria:	Connecting to the ventilator Do not be under ventilator for more than three days Apache score between 30 and 50 Having the informed consent of the patient's guardian Age range from 15 to 65 years Having a spontaneous breathing effort in addition to the forced breathing of the ventilator
Exclusion criteria:	Receiving neuromuscular blocking drugs during the study Creating conditions that cause the patient to be on the controlled modes of the ventilator for a long time (such as brain death)
Age	From 15 years old to 65 years old
Gender	Both
Phase	N/A
Groups that have been masked	No information
Sample size	Target sample size: 60
Randomization (investigator's opinion)	Randomized
Randomization description	This study is a randomized clinical trial in two intervention and control groups. The sample size was determined based on the findings of previous studies with the help of the med calc statistical software with a power of 90% and an error of 10%, 60 cases (30 people in each group). Due to the possibility of sample dropout, 10% will be added to the above sample size. First, the samples will be selected according to the available sampling method according to the entry criteria, and then using the replacement block randomization method in the two intervention groups. and control (33 people each) will be randomly assigned. In this way, 11 blocks of 6 will be selected and then one of the 6 combinations of two groups will be assigned in each block
Blinding (investigator's opinion)	Not blinded
Blinding description	
Placebo	Not used
Assignment	Parallel
Other design features

Health conditions studied	
1	
Description of health condition studied	Patients who need to be connected to a ventilator due to breathing problems or other problems
ICD-10 code	
ICD-10 code description	
Primary outcomes	
1	
Description	The duration of dependence on the ventilator
Timepoint	The number of days dependent on the ventilator
Method of measurement	check list
Secondary outcomes	
1	
Description	Length of hospitalization in the special ward
Timepoint	The number of days of hospitalization in the special ward
Method of measurement	check list
Intervention groups	

1

Description

In the intervention group, the researcher checked the mechanical ventilation status of the patients twice a day during the morning and evening shifts using the patient asynchrony management protocol and the ventilator device and, if necessary, took the necessary care and treatment based on the PVA management protocol and in coordination He will do for the patient with the ICU specialist doctor and the nurses in the ward. The control group will receive routine ward care. In the control group, the routine care of the patients is received by the relevant personnel, and the protocol was not taught to the nurse
