Iranian Registry of Clinical Trials

14 Jun 2026

Comparison of the effect of Yoga and pelvic floor muscle exercises on the sexual function index and sexual self-esteem of reproductive age women

Protocol summary

Study aim

Comparison of the effect of combined yoga exercises versus pelvic floor muscle exercises on the index of sexual performance and sexual self-esteem of reproductive age women

Design

The clinical trial has a control group, community-based, with parallel groups, without blinding, randomized, on 60 research units, and for randomization, permutation block was used by Random Allocation software.

Settings and conduct

This study will be conducted on 60 married women of reproductive age of 20-54 years and working in Shahrekord University of Medical Sciences and affiliated centers. Qualified samples are selected in a cluster and entered into two study groups through randomization. Research data will be collected using a questionnaire.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Reproductive age 20-54 years, first marriage, reading and writing literacy, no alcohol and drug addiction, living with spouse, living in Shahrekord, Absence of any known physical and mental illness, Not taking drugs that affect sexual performance - No history of surgery in genital and pelvic areas in couples.
Exclusion Criteria: Unwillingness to participate in the study

Intervention groups

The intervention includes a yoga exercise program in the form of 2 sessions per week for 6 weeks (12 sessions in total) where each session lasts from 45 minutes in the first 4 weeks to about 75 minutes in the final weeks. For both the intervention and control groups, during a training session, the stages of the natural sexual cycle, a brief description of the role of the pelvic floor muscles and the correct way to exercise the pelvic floor muscles are will be taught.

Main outcome variables

Sexual performance index; sexual self-esteem

Randomization (investigator's opinion)

Randomized

Randomization description

In order to randomly assign the samples to two intervention and control groups, tables of 6 blocks (table of random numbers) will be used. In this way, a number is included for the names of the registered people, then using 6 block tables and random allocation software, these numbers are randomly placed in one of the two groups.

Primary outcomes

1

Description

Sexual performance index: in classified sexual activity, if the score obtained from the questionnaire is equal to 36, sexual performance is good, 29 to 32 is average, and less than 23 is poor.

Timepoint

Before the intervention, immediately after the end of the intervention, one month after the end of the intervention

Method of measurement

Sexual function index questionnaire (FSFI)

2

Description

Sexual self-esteem: by adding the scores of 5 areas of sexual self-esteem, the total score of the scale is obtained, and a higher score indicates a higher sexual self-esteem. Cronbach's alpha coefficient was reported as 0.92 for the whole scale, 0.84 for skill and experience, 0.88 for attractiveness, 0.80 for control, 0.80 for moral judgment, and 0.80 for conformity.

Timepoint

Before the intervention, immediately after the end of the intervention, one month after the end of the intervention

Method of measurement

Sexual satisfaction questionnaire (SSEI-W-SF).

Secondary outcomes

empty

Intervention groups

1

Description

In addition to performing pelvic floor muscle exercises at home, the intervention group will participate in a 12-session exercise program designed by a yoga instructor and researcher in one of the clubs affiliated to Shahrekord University of Medical Sciences. The yoga exercise program is carried out as 2 sessions per week for 6 weeks, with each session lasting from 45 minutes in the first 4 weeks to 75 minutes in the final weeks, with varying degrees of intensity. The training program in each session includes three parts: warm-up movements (Pawan Mocket), Salam Barkhorshid cycle, main cycle movements (Asana) and cooling and relaxation (Shavasana). Exercises start from a low level and progress gradually. If necessary, the selected exercises are adjusted for the subjects who are not able to maintain their posture while doing it, and in this way, the principle of paying attention to the individual differences of the subjects is respected. In order to overload principle, the repetition of movements in each session increases compared to the previous session. At the beginning of each session, for 15-20 minutes, we will have warm-up exercises for joints and muscles (Pawan Mocket). These warm-up exercises include 3 general categories of movements: joint warm-up, core muscle warm-up and movements related to unblocking energy pathways. Then 10 minutes of the exercise are dedicated to the sun salutation cycle. The movements related to this cycle include stretching, strength, balance, contraction and inversion movements. After performing the sun salutation cycle, the movements of the main cycle (asana) designed by the yoga instructor are performed in a period of 20 minutes. Finally, 10 to 15 minutes are considered at the end of the workout for cooling down and relaxation movements (Shavasana).
