Impact of preoperative nursing care program on anxiety level of women undergoing surgery

Protocol summary

Summary

The aim of this study is to assess the impact of nursing care on patients' anxiety level before the surgery. In this study, anxiety level compare in two control and experimental groups during admission and before anesthetize. 60 women patients, aged between 15 and 65 years who are considered for elective surgeries (Tubal ligation, hysterectomy, cesarean section), will be divided in to two control and experimental groups randomly. In experimental group, researcher visits patients the day before surgery. In case any diagnosis such as anxiety, lack of awareness or fear, nurse presents required training. Researcher transfers the patient to surgery room and introduces her to surgery team. The control group only receive routine care.

Health conditions studied

1

Description of health condition studied

Anxiety levels before surgery

ICD-10 code
F00-F09

ICD-10 code description
Organic, including symptomatic, mental disorders

Primary outcomes

1

Description
Anxiety before surgery

Timepoint

Morning of surgery day

Method of measurement
Preoperative Anxiety Scale and the awareness
Amsterdam

Secondary outcomes

1

Description

Cortisol of Serum

Timepoint
Morning of surgery day at 8 o'clock

Method of measurement
Using laboratory techniques

2

Description

Vital signs (respiration rate, pulse rate, heart rate and systolic and diastolic blood pressure)

Timepoint
At admission time and before surgery

Method of measurement
examination by researcher

Intervention groups

1

Description

In experimental group, researcher visits patients the day before surgery and then considers by using daily activities form.
