

Clinical Trial Protocol

Iranian Registry of Clinical Trials

29 May 2026

Studying the effect of strain counterstrain therapy on shoulder pain and range of motion in People with breast cancer after mastectomy surgery with chronic active trigger point pain

Protocol summary

Study aim

The purpose is to investigate the effect of strain counterstrain treatment on pain, pressure pain threshold, shoulder range of motion, shoulder pain and disability index, and quality of life questionnaire in people with cancer after mastectomy with chronic active trigger point pain. If the hypotheses are confirmed, this method can be used as one of the effective treatment methods available in the treatment of this group of patients.

Design

Clinical trial with control group, parallel groups, randomized, on 38 patients, coins were used for randomization .

Settings and conduct

38 patients are entered in accordance with the study conditions, they are initially evaluated in patient centers, and after receiving 12 intervention sessions, the final evaluation is done at the end of the 12th session.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Age 35-65 years At least 6 months have passed since adjuvant treatment Having an active trigger point in at least two of the studied muscles The presence of pain in the upper limb Having pain 7-3
Exclusion criteria: Patients or return of breast cancer Bilateral mastectomy People with fibromyalgia Degenerative diseases of spine Taking anti-inflammatory medication in the last week Symptoms of upper extremity neuropathy People with depression People with lymphedema grade two and above Not wanting to participate in study

Intervention groups

Intervention group: in this group, in addition to the methods in the control group, since first session the strain counterstrain method will be used for the number of 5 more active trigger points in people. Control group: In the control group of subjects, after entering the study, people will be taught exercises and people will do the

exercises.

Main outcome variables

pain intensity Pressure pain threshold range of motion Shoulder Pain and Disability Index Cancer Quality of Life Questionnaire

Scientific title

Studying the effect of strain counterstrain therapy on shoulder pain and range of motion in People with breast cancer after mastectomy surgery with chronic active trigger point pain

Public title

Effect of strain counterstrain treatment on shoulder pain and range of motion

Purpose

Supportive

Inclusion/Exclusion criteria**Inclusion criteria:**

Age range 35-65 years At least 6 months have passed from adjuvant treatment (chemotherapy and radiation therapy) after mastectomy Having an active trigger point in at least two muscles from the subscapularis, pectoralis major, infraspinatus and upper trapezius muscles The presence of pain in the upper limb region according to the diffusion pattern of muscle trigger point pain Pain score 7-3

Exclusion criteria:

Patients or return of breast cancer Bilateral mastectomy People with fibromyalgia Degenerative diseases of the spine Taking pain reliever, anti-inflammatory, muscle relaxant medicine in the last week Signs and symptoms of upper extremity neuropathy People with depression who receive medication and treatment for this issue People with lymphedema grade two and above Not willing to participate in the study or wanting to leave the study

Age

Health conditions studied**1****Description of health condition studied**

unilateral mastectomy

ICD-10 code

Z90.1

ICD-10 code description

Acquired absence of breast and nipple

Primary outcomes**1****Description**

Pain intensity: It is a tool that determines the intensity of pain.

Timepoint

The beginning of the study (before the start of the intervention) - the last session (the twelfth session after the intervention)

Method of measurement

Visual analog scale: the person places a vertical mark on a continuous 100 mm line segment to indicate the intensity of pain, this line starts with the number 0, which indicates the absence of pain and discomfort, and the number 10, which indicates the worst pain that the person Ever experienced ends. In this study, the person reports the intensity of spontaneous pain, pain during active movement and pain with constant pressure applied by a pressure algometer in the upper limb area.

2

Description

Pressure Pain Threshold: The amount of direct pressure required to elicit a pain response in the target area.

Timepoint

The beginning of the study (before the start of the intervention) - the last session (the twelfth session after the intervention)

Method of measurement

Pressure pain threshold: after determining the active trigger point in the studied muscles (subscapularis, pectoralis major, infraspinatus and upper trapezius), the pressure algometer device is used to measure the pressure pain threshold of the active trigger point. The study subjects are asked to inform the pain threshold, after measuring 3 times, the average value is recorded as the pressure pain threshold.

Secondary outcomes

1

Description

Range of motion (ROM): The range of motion that occurs at a joint or set of joints.

Timepoint

The beginning of the study (before the start of the intervention) - the last session (the twelfth session after the intervention)

Method of measurement

In this study, passive range of motion of the shoulder is measured by a goniometer (standard, Saehan brand, large size).

2

Description

Shoulder Pain and Disability Index (SPDI): shoulder pain and disability index questionnaire, which aims to assess shoulder pain and disability and is filled by the individual.

Timepoint

The beginning of the study (before the start of the intervention) - the last session (the twelfth session after the intervention)

Method of measurement

This questionnaire has two dimensions, one is pain (5 questions) and the other is functional activities (8 questions) and the scoring of this questionnaire is based on a spectrum of 10 options, the score of each option is the same as the selected number, and finally the individual score is a number between zero and 130 and a larger number indicates greater disability.

3

Description

European Organization for Research and Treatment of Cancer Quality of Life Questionnaire (EORTC QLQ-C30): This questionnaire is used to measure the quality of life in cancer patients.

Timepoint

The beginning of the study (before the start of the

intervention) - the last session (the twelfth session after the intervention)

Method of measurement

This questionnaire has 30 questions in 5 functional scales including: physical (5 questions), role playing (2 questions), emotional (2 questions), cognitive (4 questions), social (2 questions) and 9 symptom domains (fatigue, nausea and vomiting, pain, shortness of breath, sleep disorder, loss of appetite, constipation, diarrhea and financial problems) and evaluates the overall quality of life.

Intervention groups

1

Description

Intervention group: In this group, in addition to the methods in the control group from the first session the strain counterstrain method will be used for the 5 more active trigger points in people. Strain counterstrain method: In this method, the trigger point is identified by touch, and the therapist increases the pressure while still touching it so that the patient reports the onset of pain. Then passively put the muscle in a comfortable (shortened) position to reduce 70% of the pain and maintain a gentle touch on the trigger point, after 90 seconds the release is done and the therapist opens the patient to the resting position. This intervention will be repeated twice for each trigger point.

Category

Rehabilitation

2

Description

Control group: In the control group of subjects, after entering the study, people will be taught exercises and people will do the exercises. Start the exercises with 5 minutes of walking, then perform active stretching of the neck and upper trunk, flexion and extension (two repetitions of 20 seconds), perform active movement of the cervical spine for flexion, extension, and rotation (one set and ten repetitions). Performing active movement of the upper limbs for flexion, extension, abduction and adduction of the shoulder (two sets and ten repetitions) and finally performing relaxation exercises with deep breathing for 5 minutes (total duration of the exercises is 25 minutes).
