The effect of low glycemic index diet on body composition and fatigue in amateur strength athletes

Protocol summary

Study aim

The effect of low glycemic index diet on body composition and fatigue factors in amateur strength athletes

Design

A clinical trial with a control group, with parallel groups, a blind strain, randomized, on 38 athletes, was used to randomize the randomized block allocation of the RAS software.

Settings and conduct

This study was conducted on strength athletes in bodybuilding in one of the clubs in Yazd city; The athletes were explained how to conduct the study and the study process, and a guide file was provided to all the athletes, which included the items that should not be used in their diet in the case group, and the study process including blood tests, measurements in the control group. The anthropometric measurements, the start and end time of the study were explained.

Participants/Inclusion and exclusion criteria

People who wish to enter the study must be in good health, between 20 and 45 years old; If they are professional athletes and use antioxidant supplements, they are not allowed to enter.

Intervention groups

In this study, we measure the effect of removing foods with a high glycemic index from the diet of strength athletes on body composition and fatigue factors.

Main outcome variables

Skeletal muscle mass; Fat mass; Fat percentage; Aspartate amino transferase; Lactate dehydrogenase; Weight; BMI;

Scientific title

The effect of low glycemic index diet on body composition and fatigue in amateur strength athletes

Public title

Effect of low glycemic index diet on body composition and fatigue

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria:

. Tendency to participate in the study . Amateur athletes
. Age between 20-45 years . Having perfect physical health . Not using antioxidant supplements in the last month

Exclusion criteria:

Using hormones and steroid drugs Using sports supplements to increase strength and energy

Age

From **20 years** old to **45 years** old

Gender

Male

Phase

N/A

Groups that have been masked

- Investigator
- Outcome assessor
- Data analyser

Sample size

Target sample size: **38**

Actual sample size reached: **37**

Randomization (investigator's opinion)

Randomized

Randomization description

The people participating in the study were divided into 2 groups of case (receiver of diet with low glycemic index) and control (regular diet) by random block allocation method and using RAS software, and followed the respective diet for 4 weeks. People who must follow a low glycemic index diet are given a list of prohibited foods during this period.

Blinding (investigator's opinion)

Single blinded

Blinding description

The participants in this study were in a separate group; Both groups were given a file, the case group received a diet and the control group continued with their normal diet and only the study process was explained from beginning to end.

Health conditions studied

1

Description of health condition studied

Body composition-fatigue factors

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Body Composition

Timepoint

At the beginning of the study and 28 days after the start of the study.

Method of measurement

Body Analysis device

2

Description

Fatigue factors: AST, LDH

Timepoint

At the beginning of the study and 28 days after the start of the study.

Method of measurement

Blood test.

Secondary outcomes

1

Description

Fat mass

Timepoint

At the beginning and 28 days later at the end of the study.

Method of measurement

Inbody 270

2

Description

Fat percentage

Timepoint

At the beginning and 28 days later at the end of the study.

Method of measurement

Inbody 270

3

Description

Skeletal muscle mass

Timepoint

at the beginning and 28 days later at the end of the study

Method of measurement

Inbody 270

4

Description

Weight

Timepoint

At the beginning and 28 days later at the end of the study

Method of measurement

Scale with an accuracy of 50 grams

5

Description

BMI

Timepoint

At the beginning and 28 days later at the end of the study

Method of measurement

Ratio of weight to height to exponentiation 2

6

Description

Abdominal circumference

Timepoint

At the beginning and 28 days later at the end of the study

Method of measurement

Meter

7

Description

hips circumference

Timepoint

At the beginning and 28 days later at the end of the study

Method of measurement

Meter

Intervention groups

1

Description

Intervention group: The intervention group is fully justified at the beginning of the study process and a consent form is obtained; At first, a blood sample will be

taken from them and an analysis and anthropometric measurements will be performed. Finally, the study will be repeated after 28 days. Food record sheets will also be given, which record 3days at the beginning, middle and end of the study. Along with strength training, foods with a high glycemic index, whose list was given to the intervention group, are removed from their diet.
