Comparison of Two Educational Intervention Methods With Mobile Application vs. Face-to-Face Instruction on Knowledge, Attitude, Practice, Perceived Self-Efficacy, and Adherence with Pap Smear Testing among Women Aged 30-59

Protocol summary

Study aim

Investigation and comparison of two methods of educational intervention by mobile phone application and face-to-face training in knowledge, attitude, performance, perceived self-efficacy and compliance to repeat pap smear test among women aged 30-59

Design

This study is a clinical trial (RCT) with two intervention groups and one control group. Randomized block method will be used to assign the participants to three groups. The envelope is used to hide the allocation

Settings and conduct

Entering, the target population is women (30-59) years old. The participants will announce their readiness to participate in the study through an internet call on several popular social networks.

Participants/Inclusion and exclusion criteria

1. A resident of Saveh city 2. Covered by the centers and has an active electronic file of the Sib system 3. Age between 30 and 59 years 4. Having marriage experience 5. More than 3 years have passed since the first sex 6. Obtaining a weak and average knowledge score in the first stage of study 7. Using a smart mobile phone to use virtual networks (ITA program) 8. Desire to participate in research

Intervention groups

The first intervention group: the intervention designed based on the training content obtained from the qualitative and review phase of the study will be presented using the face-to-face and in-person training method. The second intervention group: the intervention designed based on the training content obtained from the qualitative and review phase of the study with They will receive the use of the mobile phone application. Control group: they will not receive it during the educational study, after the study the educational

content will be provided to them.

Main outcome variables

The average score of knowledge, attitude, performance, perceived self-efficacy and adherence to re-doing the pap smear test of women

Scientific title

Comparison of Two Educational Intervention Methods With Mobile Application vs. Face-to-Face Instruction on Knowledge, Attitude, Practice, Perceived Self-Efficacy, and Adherence with Pap Smear Testing among Women Aged 30-59

Public title

Comparison of Two Educational Intervention Methods With Mobile Application vs. Face-to-Face Instruction on Knowledge, Attitude, Practice, Perceived Self-Efficacy, and Adherence with Pap Smear Testing among Women

Purpose

Education/Guidance

Inclusion/Exclusion criteria

Inclusion criteria:

1. A resident of Saveh city Covered by the centers and has an active electronic file of the Sib system Age between 30 and 59 years Having marriage experience More than 3 years have passed since the first sex Obtaining a weak and average knowledge score in the first stage of study Using a smart mobile phone to use virtual networks (ITA) Desire to participate in research

Exclusion criteria:

1. Participation in another educational program at the same time or parallel to the intervention Being pregnant now Perform hysterectomy Genital warts or cervical cancer known and under treatment Conducting a pap smear test in the last 2 years Conducting HPV screening tests in the last 10 years

Age

From **30 years** old to **59 years** old

Gender

Female

Sample size

Target sample size: **120**

Randomization (investigator's opinion)

Randomized

Randomization description

A list of individuals who have achieved poor and average knowledge scores will be compiled. These individuals will be numbered consecutively for random assignment to one of three groups: A, B, or C. This study will involve 120 participants. The method of permutation blocks will be employed for this purpose. We will utilize Random Allocation Software, which will be used to create 20 blocks of six. This software aids in balancing the number of samples allocated to each group under study. This

feature is particularly beneficial when intermediate analyses are required during the sampling process, as it ensures an equal number of samples in each group. In this study, the blocking type is consistent across all blocks. Out of the total 120 participants, groups A (control group), B (intervention group receiving face-to-face training), and C (intervention group receiving training via a mobile phone application) will each be assigned 40 participants. Upon selection of the samples, they will be contacted. A brief overview of the study, its objectives, the teaching method, and the criteria for inclusion and exclusion from the study will be provided. If they are willing to participate, they will be included in the study. If they decline, the next individual will be contacted. Written consent will be obtained from all participants agreeing to participate in the study.

Health conditions studied

1

Description of health condition studied

Cervical Cancer

ICD-10 code

C53.9

ICD-10 code description

Malignant neoplasm of cervix uteri, unspecified

Primary outcomes

1

Description

Knowledge score in the Farsi version of cervical cancer screening self-efficacy questionnaire

Timepoint

Before the intervention, immediately, one month later and three months after the intervention

Method of measurement

Persian version of cervical cancer screening self-efficacy questionnaire

2

Description

Attitude score in the Persian version of cervical cancer screening self-efficacy questionnaire

Timepoint

Before the intervention, immediately, one month later and three months after the intervention

Method of measurement

Persian version of cervical cancer screening self-efficacy questionnaire

3

Description

Self-efficacy score in the Farsi version of cervical cancer screening self-efficacy scale

Timepoint

Before the intervention, immediately, one month later and three months after the intervention

Method of measurement

Persian version of cervical cancer screening self-efficacy questionnaire

4

Description

Practice score in the Farsi version of cervical cancer screening self-efficacy questionnaire

Timepoint

Before the intervention, immediately, one month later and three months after the intervention

Method of measurement

Persian version of cervical cancer screening self-efficacy questionnaire

5

Description

Adherence to action score in Persian version of the Adherence to action pap smear

Timepoint

Before the intervention, immediately, one month later and three months after the intervention

Method of measurement

Persian version of the Adherence to action pap smear

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: The first group of the intervention will be in such a way that at first the participants will be members of the ITA group. After welcoming and introducing himself, the researcher will again remind the objectives of the research, the research team, the duration of training in this group and the timing of completing the questionnaire; Then the time and place of the first training session was announced in the group. The schedule of training sessions will be in person one day a week. These sessions include 2 training sessions to increase members' knowledge in the field of knowledge, 2 training sessions to improve women's attitudes and beliefs regarding Pap smear testing, 2 training sessions aimed at improving women's self-efficacy regarding Pap smear testing, and 1 A training session will be held with the aim of improving the performance of women regarding the Pap smear test and 1 training session will be held regarding the improvement of compliance to the Pap smear test. After 4 weeks have passed since the beginning of the training. The post-examination process will be immediate, one month and three months later.

Behavior

2

Description

Intervention group: In the second group, the intervention will be in the form that at first the participants will be members of the ITA group. After welcoming and introducing himself, the researcher will again remind the objectives of the research, the research team in this group and the schedule for completing the questionnaire, then the link to the mobile application. will be sent to them for installation. After 4 weeks from the beginning of the training. The post-test process was immediate, one month and three months later. The measurement and evaluation tools will be the same in all stages before and after the intervention

Category

Behavior

3

Description

Control group: After evaluating and comparing two educational interventions, the control group will also receive the desired intervention based on ethical principles.

Title and more details about the data/document

Part of the data related to the main outcomes can be shared

When the data will become available and for how long

The access period starts 6 months after the results are published

To whom data/document is available

The data will be made available only to researchers working in academic and scientific institutions

Under which criteria data/document could be used

Repeated measures analysis to investigate the effect of training persistence 6 months after the last intervention

From where data/document is obtainable

By sending an email to the email address of Dr. Fatemeh Zarei f.zarei@modares.ac.ir

What processes are involved for a request to access data/document

One week after sending the email from the requester to the email address of Dr. Fatemeh Zarei f.zarei@modares.ac.ir, a reply will be given.
