Minimal Clinically Important Difference (MCID) for four balance measures in people with Parkinson's disease

Protocol summary

Study aim

Determining the minimum clinically important difference (MCID) for four balance assessment tools in individuals with Parkinson's disease.

Design

Interventions will be carried out in the form of balance exercises over eight weeks. Balanced physical activity on different surfaces (hard and foam) in different vision states (eyes open and closed) will be performed as a single and dual cognitive or physical task. These tasks will be based on Gentile's taxonomy, progressing from simple to complex according to each patient's condition and level of progress. The amount of repetition and the duration of each physical activity will be based on the theory of learning. The balance activity will be designed based on four main parameters: repetition, time, type, and intensity. In terms of the repetition parameter (number of sessions per week), which suggests two to three sessions per week as suitable for balance activity, three sessions per week will be considered. In terms of the time parameter (the duration of physical activity in each session), between 45-60 minutes is deemed the most suitable time for balance activity.

Settings and conduct

Shafa Yahyaian Hospital in Tehran

Participants/Inclusion and exclusion criteria

1-Having idiopathic Parkinson's disease, as diagnosed by a neurologist and according to the criteria of the Parkinson's Disease Society Brain Bank in the UK. Having a disease level of 1 to 3 according to the Hoehn and Yahr scale. Having a score of 21 or above on the Mini-Mental State Examination.

Intervention groups

Individuals will be placed in an intervention group as available cases.

Main outcome variables

1-Berg Balance Scale 2-Dynamic Gait Index 3-Timed Up and Go

Scientific title

Minimal Clinically Important Difference (MCID) for four balance measures in people with Parkinson's disease

Public title

Investigating the clinical application of four balance measurement tools in people with Parkinson's disease

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Having idiopathic Parkinson's disease as diagnosed by a neurologist and based on the Brain Society Parkinson's Disease UK Bank criteria having disease level 1 to 3 according to the Yahr & Hoehn scale Having a score of 21 and above in the Mental Mini Examination Stat

Exclusion criteria:

Having other diseases, including diabetes and stroke

Age

From **30 years** old to **80 years** old

Gender

Description

Intervention group: Balanced physical activity on different surfaces (hard and foam) in different vision states (eyes open and closed) will be performed as a single and dual cognitive or physical task. These tasks will be based on Gentile's taxonomy, progressing from simple to complex according to each patient's condition and level of progress. The amount of repetition and the duration of each physical activity will be based on the theory of learning. Specifically, when a patient can easily repeat a pose three times, the task will become more difficult. This progression will change from standing on two legs with eyes open in a short period of time without a cognitive or physical dual task, to standing on one leg on foam with eyes closed along with a cognitive or physical task. The balance activity will be designed based on four main parameters: repetition, time, type, and intensity. In terms of the repetition parameter (number of sessions per week), which suggests two to three sessions per week as suitable for balance activity, three sessions per week will be considered. In terms of the time parameter (the duration of physical activity in each session), between 45-60 minutes is deemed the most suitable time for balance activity. The type of physical activity (control of the body's center of gravity from static to dynamic) will be selected based on Gentile's

theory, progressing from simple to complex as described above
