Comparison of the effectiveness of local administration of magnesium sulfate in the latent phase of labor on the improvement of effacement, dilatation, and duration of labor in primiparous and multiparous women

Protocol summary

Study aim

Comparison of the effectiveness of local administration of magnesium sulfate in the latent phase of labor on the improvement of effacement, dilatation, and duration of labor in primiparous and multiparous women

Design

The clinical trial has a control group, with parallel groups, double-blind, randomized, phase 3, which will be conducted on 75 women admitted in the delivery room of Ayatollah Mousavi Hospital in Zanjan. People will be assigned to two intervention groups and one control group using a random sampling method of 6 blocks.

Settings and conduct

The setting is the delivery room of Ayatollah Mousavi Hospital in Zanjan. The samples will be allocated to two intervention groups and one control group by a random block method of 6. The intervention group will receive ten cc of 50% magnesium sulfate in the latent phase of labor. Distilled water will be used for the placebo group with the same prescription. The study will be double-blind.

Participants/Inclusion and exclusion criteria

Inclusion criteria Pregnant women with a singleton pregnancy, The cephalic presentation, Gestational age 42 - 37 weeks, Age of women between 18-35 years, Spontaneous start of labor, Dilatation less than 3 cm, Body mass index between 19.8 and 30 kg/m², Low-risk pregnancy Exclusion criteria Receiving infertility treatments, multiple pregnancies, History of heart disease, Having a history of a severe allergy to magnesium sulfate, The existence of contraindications for natural childbirth

Intervention groups

Ten cc of 50% magnesium sulfate (up to two doses) will be poured between the fingers on the cervix during the vaginal examination during the latent phase of labor to cover the entire cervix. Distilled water will be used for

the placebo group with the same prescription.

Main outcome variables

Effacement, Dilatation, and Duration of Labor

Sample sizeTarget sample size: **75****Randomization (investigator's opinion)**

Randomized

Randomization description

Eligible people will be selected during regular visits and then will be assigned to two intervention groups and one control group using a random sampling method of 6 blocks. For this purpose, blocks of 6 will be selected using a table of random numbers so that the sample size reaches 75 people. Blocking will be done by a person not involved in sampling. Each of the generated random sequences will be recorded on a card and the cards will be placed in the envelopes. Finally, the lids of the envelopes will be glued and placed inside a box. At the start of the intervention to identify the order of the participants, one of the envelopes will be opened in order and the assigned group of that participant will be revealed.

Blinding (investigator's opinion)

Double blinded

Blinding description

The study will be double-blind. Pregnant women and the person controlling the progress of labor and delivery will not know about the grouping and type of intervention. Examinations and registration of labor progress in the latent phase will be done and recorded every 4 hours by a research associate.

Health conditions studied**1****Description of health condition studied**

Improvement of dilation, effacement of cervix , and labor duration

ICD-10 code**ICD-10 code description****Primary outcomes****1****Description**

Cervical effacement, dilation, and duration of labor

Timepoint

Before the intervention, 4 hours and then 8 hours after the intervention

Method of measurement

Vaginal examination

2

Description

Hemoglobin and hematocrit

Timepoint

24 hours after delivery

Method of measurement

blood test

Secondary outcomes

empty

Intervention groups

1

Description

Ten cc of 50% magnesium sulfate (up to two doses) will be poured between the fingers on the cervix during the vaginal examination during the latent phase of labor to cover the entire cervix. During the first half hour after using the medicine, the mother will be asked to rest on the bed in order to better absorb the medicine. In case of rupture of the fetal membranes during or less than half an hour after the local use of the drug, 10 cc of magnesium sulfate will be used again after the end of active shedding.

Category

Treatment - Drugs

2

Description

During the latent phase of labor, ten cc of distilled water (up to two doses) will be poured between the fingers on the cervix during the vaginal examination to cover the entire cervix.
