

# Clinical Trial Protocol

## Iranian Registry of Clinical Trials

08 Jul 2026

### The effect of training based on Leventhal's self-regulation model on anxiety, stress, depression and illness Perception in women with multiple sclerosis

#### Protocol summary

##### Study aim

The aim is to investigate the effect of training based on Leventhal's self-regulation model on anxiety, stress, depression and understanding of the disease in women with multiple sclerosis.

##### Design

The randomized clinical trial has a parallel intervention and control group, without blinding, on 64 MS patients. Sealed envelope site and blocks of four were used for randomization.

##### Settings and conduct

This study will be conducted on women with MS and in the MS Association of Central Province. in a way that includes two control and intervention groups in the form of pre-test and post-test on two occasions. After randomizing the sample size in two groups; In addition to routine training, people in the intervention group will receive self-regulation training based on the Levant model in four to five non-simultaneous sessions and in two to three simultaneous sessions, and in the control group, they will receive only the usual training provided by the clinic's treatment staff. will be

##### Participants/Inclusion and exclusion criteria

Women aged 18 to 50 with MS who have been diagnosed with MS for at least one year and do not have any other disease or disorder.

##### Intervention groups

In addition to routine training, people in the intervention group will receive self-regulation training based on the Levant model in four to five non-simultaneous sessions and in two to three simultaneous sessions, and in the control group, they will receive only the usual training provided by the clinic's treatment staff.

##### Main outcome variables

Stress, anxiety and depression and understanding of the disease

**Scientific title**

The effect of training based on Leventhal's self-regulation model on anxiety, stress, depression and illness Perception in women with multiple sclerosis

**Public title**

The effect of training based on Leventhal's self-regulation model on anxiety, stress, depression and illness Perception in women with multiple sclerosis

**Purpose**

Education/Guidance

**Inclusion/Exclusion criteria****Inclusion criteria:**

Examination of the disease based on the medical record and expert diagnosis Age between 18-50 years A history of illness of at least one year Access to a smartphone and having media literacy (ability to work with a smartphone) Not being in the relapse stage Not suffering from any other acute or chronic disease based on self-report and medical record, ability to speak (speech and hearing) Not having dementia and known mental disorders based on the person's statements and medical record Patients should not receive other education related to methods of dealing with stress, anxiety and depression Minimum literacy Obtaining a score of 0-5.5 on the Extended Disability Status Scale Not suffering from other autoimmune diseases (psoriasis, myasthenia gravis) Not suffering from neurological diseases (Parkinson, epilepsy)

**Exclusion criteria:**

Inability of the patient to continue participating in the research for any reason (accident, death or migration to another city) Unwillingness to continue cooperation pregnancy drug use Physical limitations Making specific changes during the study in people's lifestyle or treatment process

**Age**

From **18 years** old to **50 years** old

**Gender**

Female

**Phase**

N/A

**Groups that have been masked**

*No information*

**Sample size**

Target sample size: **64**

**Randomization (investigator's opinion)**

Randomized

**Randomization description**

In this study, random blocks will be used in order to conceal the randomized allocation of concealment and balance during and after the study. For this purpose, the site sealed envelope is used. The total sample size, the number of studied groups, and the number of blocks in question (blocks of 4) will be entered on the mentioned site, and its output will be a randomized list including the number of samples separated by the studied groups (control and intervention). Then, the eligible research samples will be selected and based on the priority of reference, each of them will be assigned a code, and by matching that number with the random block allocation list, the patients participating in the research will be

assigned to the intervention group and the control group

**Blinding (investigator's opinion)**

Not blinded

G35

**ICD-10 code description**

Multiple sclerosis

**Primary outcomes****1****Description**

Stress is one of the consequences of MS.

**Timepoint**

Once before the intervention, once immediately after the intervention, four weeks after the intervention

**Method of measurement**

stress, anxiety and depression questionnaire

**2****Description**

Anxiety is one of the consequences of MS.

### **Timepoint**

Once before the intervention, once immediately after the intervention, four weeks after the intervention

### **Method of measurement**

stress, anxiety and depression questionnaire

### **3**

#### **Description**

Depression is one of the consequences of MS.

#### **Timepoint**

Once before the intervention, once immediately after the intervention, four weeks after the intervention

#### **Method of measurement**

stress, anxiety and depression questionnaire

### **4**

#### **Description**

The understanding of the disease is the influencing factor on how patients deal with their disease.

#### **Timepoint**

Once before the intervention, once immediately after the intervention, four weeks after the intervention

#### **Method of measurement**

Brief Illness Perception Questionnaire

## **Secondary outcomes**

empty

## **Intervention groups**

### **1**

#### **Description**

Intervention group: In addition to routine training, people in the intervention group will receive self-regulation training based on the Leventhal model in four to five offline sessions through virtual networks as a group and two to three online sessions through Skype as a group. Each offline session will be multimedia and average 20 minutes, and each online session will be lecture and average 15 minutes. All sessions will be designed based on the two cognitive and emotional dimensions of Leventhal's self-regulation model and will be designed within 5 weeks.
