Study and comparison of the Effect of TECAR Therapy and physiotherapy in the Symptoms and Functions of the Patients with Knee Osteoarthritis

Protocol summary

Functional status based on WOMAC questionnaire, pain intensity based on VAS questionnaire

Study aim

Determining and comparing the effect of TECAR therapy and physiotherapy in improving the symptoms and performance of patients with knee osteoarthritis

Design

A randomized controlled, parallel-group, single-blinded, phase 3 clinical trial of 46 patients

Settings and conduct

The present study will be conducted in physical medicine and rehabilitation clinic of Amin Hospital of Isfahan University of Medical Sciences in 2023-2024. The patients are divided into two groups, A and B, performing classical physiotherapy intervention and TECAR therapy, respectively. Functional status is measured based on WOMAC questionnaire and pain intensity based on VAS questionnaire immediately after treatment, 1 month later and 3 months later. Comparisons in two groups are made based on primary variables with the help of independent t-tests or chi-score for quantitative and qualitative variables, respectively. All analyzes are performed at the 5% error level and with the help of SPSS24 software.

Participants/Inclusion and exclusion criteria

Diagnosis of knee osteoarthritis by physical therapist and grades 2 and 3 of knee osteoarthritis based on Kellgren-Lawrence radiological grading; age 40 to 80 years; duration of pain more than one month; VAS pain score of at least 3; informed written consent to participate in the study

Intervention groups

Group A receives standard physiotherapy treatment, which includes IR, TENS, HP. The number of physiotherapy sessions is 10 sessions every other day for 60 minutes in the physiotherapy center of Amin Hospital of Isfahan University of Medical Sciences. In group B, TECAR therapy is performed using the WINBACK device, made in France, in the physiotherapy department of Amin Hospital, and the number of sessions is 6 twice a week.

Main outcome variables

General information

Reason for update

wrong entrance of Kellgren-Lawrence grades including criterion and number of patients

Scientific title
Study and comparison of the Effect of TECAR Therapy and physiotherapy in the Symptoms and Functions of the Patients with Knee Osteoarthritis

Public title
Study and comparison of the Effect of TECAR Therapy and physiotherapy in the Symptoms and Functions of the Patients with Knee Osteoarthritis

Purpose
Supportive

Inclusion/Exclusion criteria
Inclusion criteria:
Diagnosis of knee joint osteoarthritis by a physical therapist and selecting patients with moderate to severe knee osteoarthritis based on physical examination and grades 2 and 3 osteoarthritis based on the Kellgren-Lawrence radiographic grading. Duration of knee pain over 1 month VAS score of at least 3 Written informed consent for participation in study
Exclusion criteria:
Contraindications of TECAR device such as pregnancy, pacemaker, cancer, open wounds, skin lesions, skin sensitivity and lack of heat perception No written informed consent Hyaluronic acid injections during the past 6 months or steroid injection 6 weeks before entry

Age
From **40 years** old to **80 years** old

Gender
Both

Phase
3

Groups that have been masked

- Outcome assessor
- Data analyser
- Data and Safety Monitoring Board

Sample size
Target sample size: **46**

Randomization (investigator's opinion)
Randomized

Randomization description
Patients who will included in the study, will be randomly assigned to one of the two intervention groups. The randomization method is to generate 23 random numbers from 1 to 46 by Excel software to be assigned to the first intervention group and then assigning the remaining 23 numbers to the second intervention group.

Blinding (investigator's opinion)
Single blinded

Blinding description
The person who analyses the data is someone other than the researcher and is kept blind and unaware of the interventional groups.

Placebo
Not used
