Rocabado exercises vs. Myofascial Release: Comparative effects in patients with Temporomandibular Joint Dysfunction

Protocol summary

Study aim

The aim of this study was to compare the effects of Rocabado exercises and myofascial release on pain and jaw mobility in patients with temporomandibular joint dysfunction.

Design

A single-blinded, randomized clinical trial was conducted with thirty participants included by using convenient sampling technique.

Settings and conduct

The study settings included physical therapy out patient departments of Allied Hospital and Madinah Teaching Hospital, Faisalabad. The participants were blinded of the treatment given to them.

Participants/Inclusion and exclusion criteria

The participants having age 18 to 30 years with mild to moderate temporomandibular joint dysfunction according to fonseca questionnaire and mild to moderate pain levels on numeric pain rating scale with restricted mouth opening were included in the study. the subjects with the history of any recent surgery, temporomandibular joint (TMJ) hypermobility, severe osteoporosis, unhealed fracture of mandible and advanced diabetes were excluded.

Intervention groups

There were two interventional groups named as group A (Rocabado exercises) and group B (Myofascial release technique). The participants of group A received a set of six exercises named as Rocabado exercises as a treatment. These six exercises included rest position of tongue, shoulder posture correction, stabilized cervical flexion, axial extension of neck, controlled TMJ rotation and rhythmic stabilization technique. The participants of group B received myofascial release technique as a treatment approach which included the myofascial release of masseter and temporalis muscles.

Main outcome variables

The main outcome variables were severity of dysfunction, pain, functional limitation and mouth

opening range of motion.

Sample size

Target sample size: **30**

Actual sample size reached: **30**

Randomization (investigator's opinion)

Randomized

Randomization description

Randomization process was done using chit and draw or lottery method. Thirty chits were made in order to allocate the participants in both groups. Thirty chits were made and with every participant coming, one chit was drawn and it happened in a way that all even numbered chits were allocated into group A while all odd ones into group B.

Blinding (investigator's opinion)

Single blinded

Blinding description

The treatment techniques used in this study are soft tissue techniques out of which one was manual and the other was exercise based. Both groups received a baseline treatment in which therapeutic ultrasound was used so the groups were similar and comparable in order to blind the participants. The groups were homogenous at baseline i.e. of same age group and of similar levels of pain and severity of dysfunction. The interventions in the two groups were sufficiently similar in terms of implementation without the use of any kind of instrument in either group.

Health conditions studied**1****Description of health condition studied**

Temporomandibular Joint Dysfunction

ICD-10 code

M26.60

ICD-10 code description

Temporomandibular joint disorder, unspecified

Primary outcomes**1****Description**

Mouth Opening Range of Motion

Timepoint

It was measured before and after intervention.

Method of measurement

A ruler calibrated in millimeters was used to measure this outcome.

2**Description**

Functional Limitation of Jaw

Timepoint

it was measured before and after treatment i.e. at baseline and at 4th week.

Method of measurement

Jaw Functional Limitation Scale was used to measure it.

Secondary outcomes

1

Description

Pain

Timepoint

it was measured before treatment and after treatment.

Method of measurement

Numeric pain rating scale was used

2

Description

Severity of dysfunction

Timepoint

before and after treatment

Method of measurement

Fonseca Anamnestic Index Questionnaire was used.

Intervention groups

1

Description

Intervention group: The participants of group A received therapeutic ultrasound (3 MHz, 1.2 W/cm² for 3 minutes) over TMJ and simple jaw exercises as a baseline treatment. then they were given an exercise protocol which was named as Rocabado exercises which included a set of six different exercises. each exercise was repeated for 6 six times. the treatment was given thrice a week over a period of 4 weeks.

Rehabilitation

2

Description

Intervention group: The participants of group B received therapeutic ultrasound (3 MHz, 1.2 W/cm² for 3 minutes) over TMJ and simple jaw exercises as a baseline treatment. then they were given myofascial release technique for masseter and temporalis muscles. the participants were made to assume the side-lying position with affected TMJ on the top. gel was applied over these areas and then the muscles were slowly released. the treatment was given thrice a week over a period of 4 weeks.
