

Clinical Trial Protocol

Iranian Registry of Clinical Trials

10 Jun 2026

Effects of McGill versus Lee Stabilization Exercises on Pain, Disability, Range of motion, Quality of life and Endurance in Patient with Chronic Nonspecific Low Back Pain

Protocol summary

Study aim

To compare the effects of Mc Gill versus Lee stabilization exercises on pain, disability, range of motion, quality of life and endurance in patient with chronic nonspecific low back pain

Design

The trial will be conducted at Sir Ganga Ram Hospital, Lahore. The participant will be blinded by the concealment of the technique that will be used on them.

Settings and conduct

Randomized clinical trial, single blinded study, two parallel groups with 32 patients from Sir Ganga Ram Hospital, Lahore.

Participants/Inclusion and exclusion criteria

Inclusion criteria Both male and female patient Age 30-50 years Patient with a history of 3 months nonspecific low back pain Pain intensity (3-7) according to NPRS score Exclusion Criteria Any lumbar surgery Spinal stenosis Neurological dysfunction Systemic disease Pregnancy

Intervention groups

Intervention group 1 :The Mc Gill group in the study will follow a six-week exercise regimen, where they will participate in sessions thrice a week week with 6-10 repetition : □ Curl-Up, □ Bird-Dog, □ Side Plank
Intervention group 2: The Lee Stabilization group in the study will follow a six-week exercise protocol specific to the Lee Stabilization method, attending sessions three times a week. The main exercises will be Upper-Body Extension, Alternate Arm and Leg Lift, Alternate Arm and Leg Extension on All Fours, Diagonal Curl Up and Curl up with arms at sides, tilt pelvis to flatten back.

Main outcome variables

Pain, disability, range of motion, quality of life and endurance

Randomization (investigator's opinion)

Randomized

Randomization description

Randomization will be done by using sealed envelopes which involves assigning participants to different groups by randomly selecting an envelope that contains their group assignment. This will ensure reduced bias in allocation of interventions. Simple randomization method is used to allocate participants to different groups

Blinding (investigator's opinion)

Single blinded

Blinding description

In the trial the participant(who are willing to participate) is blinded by not knowing or being unaware which intervention they are receiving , but the researcher (physiotherapist) know. This trial will be single blinded. Researcher will be responsible for care for participants during the trial, data collectors, outcome assessors, and with lesser importance Data Safety .

Data Dictionary

No - There is not a plan to make this available

Title and more details about the data/document

Consent form in its original format with no information about any participant study protocol -how the intervention was given to both groups

When the data will become available and for how long

Data would be available after the completion of the research

To whom data/document is available

People working in an academic and clinical setting can have access to the above mentioned information/documents

Under which criteria data/document could be used

Data can be used for research paper

From where data/document is obtainable

Data can be requested at following email:
sumballiaqat10@gmail.com

What processes are involved for a request to access data/document

One can ask for data at the given email address and it would be provided after knowing the general implications of sharing that particular data
