Comparative Effects Of Eldoa And Post-Facilitation Stretching Technique On Low Back Pain And Functional Performance In Patients With Quadratus Lumborum Tightness

Protocol summary

Study aim

The aim of this study is to associate the effects of the ELDOA versus the (PFS) Post Facilitation Stretching technique to treat symptoms of Quadratus lumborum tightness affecting functional performance in (NSLBP) non-specific LBP patients.

Design

A Randomized Clinical Trials (Quantitative Study)

Settings and conduct

Participants of LBP were selected from the Outdoor Patient Department of Madina Teaching Hospital Faisalabad and Allied Hospital Faisalabad. It was of 4 months duration for the study to be completed after the approval of the synopsis.

Participants/Inclusion and exclusion criteria

Inclusion criteria • 18 to 35 years adult • Both males and females • Study participants who are willing to take part • Participants having 3 to 7 scores on NPRS • No recent surgery in the past six months Exclusion criteria • No leg symptoms in the last week • Any Neurological disorders • Patients who have undergone back, pelvis, hip, or knee surgery within the preceding six months, as well as those with any history of lower limb fractures • Pregnancy (All trimesters) • Any medical condition contraindicatory to physical activity

Intervention groups

Participants were screened through the selection criteria and were recruited into the study. The patients signed informed consent forms subsequent to subjects, which were randomly allocated into different groups. The participants were separated into two groups, both of which were part of the experimental condition, and depending upon the group allocation, the treatment plan's sequence and scheduled period were provided to the patients. Measurements were taken at baseline before treatment protocol and after the treatment performed at the end of 2nd week. There were three

sessions per week for two weeks, i.e. six sessions.

Main outcome variables

- Pain, ROM, Tightness, Disability

Comparative Effects Of Eldoa And Post-Facilitation
Stretching Technique On Low Back Pain And Functional
Performance In Patients With Quadratus Lumborum
Tightness

Public title
ELDOA and PFS technique on low back pain patient with
Quadratus lumborum tightness

Purpose
Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

18 to 35 years adult Both males and females Study
participants who are willing to take part Participants
having 3 to 7 scores on NPRS No recent surgery in the
past six months

Exclusion criteria:

No leg symptoms in the last week Any Neurological
disorders Patients who have undergone back, pelvis, hip,
or knee surgery within the preceding six months, as well
as those with any history of lower limb fractures
Pregnancy (All trimesters) Any medical condition
contraindicatory to physical activity

Age

From **18 years** old to **35 years** old

Gender

Both

Randomization (investigator's opinion)

Randomized

Randomization description

Convenient Sampling randomization. Using the Random
Number Table method, the 30 participants were
allocated into groups, i.e., Groups A and B.

Blinding (investigator's opinion)

Single blinded

Blinding description

Participants were blinded until the cessation of treatment
session.

ICD-10 code description

Panniculitis affecting regions of neck and back,
thoracolumbar region

Primary outcomes

1

Description

Quadratus Lumborum Tightness

Timepoint

Before intervention and at 2 weeks after intervention (6
sessions total)

Method of measurement

Side bend test by using measuring tape

2

Description

Pain

Timepoint

Before intervention and at 2 weeks after intervention (6
sessions total)

Method of measurement

NPRS scale

3

Description

Lumbar range of motion

Timepoint

Before intervention and at 2 weeks after intervention (6 sessions total)

Method of measurement

Schober's test

Secondary outcomes

1

Description

Functional Limitation

Timepoint

Before intervention and at 2 weeks after intervention (6 sessions total)

Method of measurement

LEFS

2

Description

Disability

Timepoint

Before intervention and at 2 weeks after intervention (6 sessions total)

Method of measurement

ODI

Intervention groups

1

Description

Intervention group 1; ELDOA group: Warm up before starting; The session will be for two weeks, alternate days a week, once daily. Hold the static position according to spinal level for 60 seconds or about one minute and breathe normally. Hold each rep for ten to thirty seconds, L4-L5 ELDOA posture was performed by asking the patient to slightly stretch their neck, to draw chin downward and backward, complete shoulder flexion and arms parallel to shoulder, upper limbs in external rotation, shoulder blades in upward rotation, wrists in complete extension, The pelvis is neutral and the spine is straight and supported by the wall, Lower limbs externally rotated, Knees pulled back in 90 degrees flexion, heels hip distance, by maintaining ankle dorsiflexion and eversion actively and Actively draw knees toward the floor. Repeat this procedure 3 to 4 times once a day.

Category

Rehabilitation

2

Description

Intervention group 2; Post Facilitation Stretching Technique: The session will be for two weeks, alternate days a week, once daily. Post Facilitation Stretching

(PFS) technique was performed as the QL of the involved side will be in the mid-range, Patient will be asked to perform contractions of the affected muscle (Isometrically) against resistance for 10 seconds, Stretch will be applied in a new range and will be given 10 second hold and then relaxed for 10 seconds. The procedure will be repeated 3 - 5 times once a day.
