

Clinical Trial Protocol

Iranian Registry of Clinical Trials

10 Jun 2026

The role of placebo and nocebo in the effectiveness of dynamic tape on the postural control, electrical muscle activity of selected muscles, and the performance of athletes with chronic ankle instability

Protocol summary

Study aim

This study aimed to determine the impact of placebo and placebo mentality on the effectiveness of dynamic tape on posture control, the electrical activity of selected muscles, and functional performance in athletes with chronic ankle instability.

Design

A clinical trial, crossover design, double-blind, randomized on 32 patients. A lottery is used for randomization.

Settings and conduct

The study will take place in the sports rehabilitation laboratory at Arak University. The participants will be athletes with chronic ankle instability. They will visit the laboratory on three separate days to perform tests under three different taping expectations.

Participants/Inclusion and exclusion criteria

The inclusion criteria: a history of ankle sprain two or more times; a sensation of fear and instability in ankle function; a score of 24 or lower on the Cumberland Ankle Instability Tool (CAIT \leq 24); and confirmation of ankle functional instability; no history of using dynamic tape). The exclusion criteria include a history of previous surgery on the lower limb; a history of fracture or acute injury to the musculoskeletal structures or joints of the lower limb (such as sprains, fractures, etc.) within the three months prior to the study.

Intervention groups

We will conduct this study with one group under three different conditions, each with a different intervention: 1. The first intervention involves creating a positive expectation (placebo) about the dynamic tape. 2. The second intervention involves creating a negative expectation (nocebo) about the dynamic tape. 3. The third intervention involves creating a neutral expectation about the dynamic tape. 4. The fourth intervention: the measurement is performed in conditions without taping.

Main outcome variables

Posture control, the electrical activity of selected muscles, and functional performance

Scientific title
The role of placebo and nocebo in the effectiveness of dynamic tape on the postural control, electrical muscle activity of selected muscles, and the performance of athletes with chronic ankle instability

Public title
positive expectation, negative expectation and taping

Purpose
Prevention

Inclusion/Exclusion criteria
Inclusion criteria:
A history of ankle sprain that requires medical treatment twice or more Feeling of fear and instability of ankle function Obtaining a score less than or equal to 24 from the Cumberland Questionnaire (CAIT \leq 24) Obtaining a score between -2 and +2 on a five-point Likert scale for individual mentality towards the influence of the taping
Exclusion criteria:
Having a history of previous surgery in the lower limbs Having a history of fractures and acute injuries of the musculoskeletal structure or joints of the lower limbs (such as sprains, fractures, etc.) in the three months leading up to the research led to the loss of at least one day of physical activity. History of using dynamic tape

Age
From **18 years** old to **30 years** old

Gender
Male

Phase
N/A

Groups that have been masked

- Data analyster

Sample size
Target sample size: **32**

Randomization (investigator's opinion)
Randomized

Randomization description
Participants are required to visit the sports science laboratory at Arak University on three separate days. Evaluations will be conducted under three conditions: positive mental induction, negative mental induction, and neutral, over three different days (sessions). The lottery is used to determine which criteria will be used to evaluate the tests in each session. At the start of the first session, the subject selects one of three different conditions through a lottery, and the tests are carried out accordingly. In the second session, a draw is conducted between the two remaining conditions. Then, in the third session, the third condition is tested.

Blinding (investigator's opinion)
Double blinded

Blinding description
The participants are unaware of the intervention due to

their positive, negative, and neutral mental expectations. Additionally, the collected data is provided to the analysts in code form, and they are unaware of the evaluated mentalities.

Placebo
Used

Assignment

Health conditions studied

1

Description of health condition studied

Ankel instability

ICD-10 code

M25.373

ICD-10 code description

Other instability, unspecified ankle

Primary outcomes

1

Description

Electromyographic activity of muscle

Timepoint

With positive expectation from the dynamic tape, with negative expectation from the dynamic tape, with usual expectation from the dynamic tape

Method of measurement

Electromyography

2

Description

Postural control

Timepoint

With positive expectation from the dynamic tape, with negative expectation from the dynamic tape, with usual expectation from the dynamic tape

Method of measurement

Pedoscan

3

Description

Functional performance

Timepoint

With positive expectation from the dynamic tape, with negative expectation from the dynamic tape, with usual expectation from the dynamic tape

Method of measurement

Functional test

Secondary outcomes

empty

Intervention groups

1

Description

Control group: In this condition, dynamic type will be applied on the ankle. The test will be taken with the usual mentality of the person.

Category

Prevention

2

Description

Intervention group 1: In this condition, dynamic type is applied on the ankle and positive mental expectation is induced to the participants.

Category

Placebo

3

Description

Intervention group 2: In this condition, dynamic type is applied on the ankle and negative mental expectation is induced to the participants.

Category

Placebo
