The effect of eight weeks of combined aerobic-electrical stimulation and resistance-electrical stimulation exercises on the serum levels of IL-6, vWF, LDL, HDL and ADAMTS13 activity in men with ischemic stroke

Protocol summary

Study aim

Determining the effect of eight weeks of combined aerobic-electrical stimulation and resistance-electrical stimulation exercises on the serum levels of IL-6, vWF, LDL, HDL and ADAMTS13 activity in men with ischemic stroke.

Design

Due to the use of a human sample, this research is carried out in a semi-experimental way and in the form of a pre-test, post-test research design. The statistical population of this research is 40 men suffering from ischemic stroke from the clients of Tavana Physiotherapy Clinic in Hamedan, who were randomly divided into four groups of 10 people, including the combined exercise group (aerobic-electrical stimulation), the combined exercise group (resistance-electrical stimulation), the group of electrical stimulation alone and the control group are divided.

Settings and conduct

Before the start of training and 48 hours after the last training session, blood sampling will be done from all the subjects fasting by a laboratory expert. Then, after clotting and centrifugation, the serum sample will be separated and then in Hakim Hamedan laboratory at -80 degrees. Centigrade is kept until the levels of serum IL-6, vWF, LDL, HDL and ADAMTS13 activity are measured with an ELISA kit.

Participants/Inclusion and exclusion criteria

Entry requirements: Men with first or second ischemic stroke Age range 55-85 years Not taking any food supplements The patient has at least grade 3 muscle strength Able to walk at least 10 meters unaided or with assistive devices Non-entry conditions: Cardiovascular patients, hemorrhagic stroke

Intervention groups

Three intervention groups (aerobic-electrical stimulation, resistance-electrical stimulation and electrical

stimulation only) and a control group that has no intervention until the end of the research.

Main outcome variables

The serum levels of IL-6, vWF, LDL, HDL and ADAMTS13 activity

Scientific title

The effect of eight weeks of combined aerobic-electrical stimulation and resistance-electrical stimulation exercises on the serum levels of IL-6, vWF, LDL, HDL and ADAMTS13 activity in men with ischemic stroke

Public title

The effect of exercise with electrical stimulation on inflammation and hemostasis system in stroke patients

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria:

Men with first or second ischemic stroke with right or left hemiparesis Age 55-85 years Not taking any food supplements for 3 months before the research The patient has at least grade 3 muscle strength from manual muscle test Able to walk at least 10 meters without assistance or with assistive devices

Exclusion criteria:

Cardiovascular discomfort The patient's inability to perform physical activity Hemorrhagic stroke

Age

From **55 years** old to **85 years** old

Gender

Male

Phase

N/A

Groups that have been masked

- Participant

Sample size

Target sample size: **40**

Randomization (investigator's opinion)

Randomized

Randomization description

The sampling framework was prepared by preparing a list including all subjects, which were numbered from 1 to 40. Then random numbers from 1 to 40 were selected using the Random Number Generator. Each number was placed in aerobic, resistance, electrical stimulation and control groups, which were finally divided into four groups of 10 people.

Blinding (investigator's opinion)

Single blinded

Blinding description

All the subjects were informed about the objectives of the research from the beginning, but they were not given information about the research and intervention groups. They only did the exercises of each session under the supervision of the researcher.objectives.
