

Clinical Trial Protocol

Iranian Registry of Clinical Trials

10 Jun 2026

Examining the impact of family-based educational support programs on stigma and mental health in women who have experienced abortion.

Protocol summary

Study aim

Evaluation of a Family-Centered Educational Support Program's impact on stigma and mental health in women with abortion experiences.

Design

A clinical trial with a parallel control group was conducted on 60 women who had experienced miscarriages. The study was two-way blinded and randomized, with random allocation software utilized for randomization.

Settings and conduct

Field of Study: Behavioral Sciences This study aims to assess the effectiveness of a family-centered educational and supportive intervention in reducing psychological distress and perceived stigma related to miscarriage among women in Shahrekord, Iran 2023. A quasi-experimental pre-post test design will be used to compare the outcomes of an intervention group with those of a control group. This study features an 8-week, 60-minute family-centered educational program as the intervention. Participants in the intervention group will begin the program two weeks after experiencing a miscarriage, while the control group will receive standard care. Additionally, the husbands of participants in the intervention group will attend two educational sessions. Participants will complete questionnaires before the program starts, immediately after it ends, and again two months later.

Participants/Inclusion and exclusion criteria

Inclusion Criteria: Written informed consent; no history of elective abortion; no history of infertility. Exclusion Criteria: Unwillingness to continue participation; a history of recurrent miscarriages; becoming pregnant.

Intervention groups

The intervention group will participate in an eight-session educational and support program. Additionally, the spouses of participants will attend two in-person training sessions. The control group will receive standard post-miscarriage care.

Main outcome variables

Mental health and stigma.

O03

ICD-10 code description

Spontaneous abortion

Primary outcomes**1****Description**

Individual stigma scores from the miscarriage stigma questionnaire and mental health scores on the 21-item Depression, Anxiety, and Stress Scale (DASS-21).

Timepoint

At pre-intervention, post-intervention, and at the 8-week follow-up

Method of measurement

Individual-Level Abortion Stigma Questionnaire (ILAS) and the DASS-21 Mental Health Questionnaire.

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Received routine post-miscarriage care, which included eight 60-minute educational and supportive sessions, as well as two in-person educational sessions for their partners.

Category

Rehabilitation

2

Description

Control group: The control group received standard care, which included one follow-up appointment during the first week after the abortion and another session between one month and 40 days post-abortion. This care involved education on warning signs, post-abortion support, and parenting counseling for couples.
