The Effect of Incentive Spirometry and Respiratory Physiotherapy on Improving Respiratory Function in Patients Following Chest Injuries

Protocol summary

Study aim

The effect of incentive spirometry and respiratory physiotherapy on improving respiratory function in patients after chest injury

Design

Clinical trial with control group; single-blind; randomized; on 64 patients; Random allocation software version 2 was used for randomization

Settings and conduct

After selection, demographic characteristics of patients were collected. The primary goals of this study included changes and results of PFT that were performed on all patients at the end of the third day of the study. the assessment of the patient's oxygenation status was recorded each time before and after the intervention. In the intervention group, both incentive spirometry and respiratory physiotherapy were used, while in the control group, only respiratory physiotherapy exercises were performed.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Age range 18-65 years, consciousness, injury severity score ≥ 11 , non-penetrating injury with rib fracture ≥ 1 Exclusion criteria: unwillingness to participate, loss of consciousness level < 14 , chronic obstructive pulmonary disease, asthma, history of heart disease, venous obstruction, coagulation problems after abdominal, thoracic, brain and eye surgery

Intervention groups

The correct method of incentive spirometry involves placing the patient in a semi-sitting position and maintaining a deep breath for a maximum of 2 to 3 seconds and then exhaling. This process was performed daily for at least one hour for three consecutive days, 10 times a day in the intervention group. Respiratory physiotherapy exercises were performed under supervision of two trained nurses in both groups. In the comparison group, incentive spirometry wasn't performed

Main outcome variables

Pulmonary oxygen saturation (SpO₂), and ABG status including pH, pO₂ and pCO₂, and FVC; FEV₁; (FEV₁/FVC) before and after the intervention between control and intervention group

Scientific title

The Effect of Incentive Spirometry and Respiratory Physiotherapy on Improving Respiratory Function in Patients Following Chest Injuries

Public title

The effect of chest physiotherapy on respiratory function after chest trauma

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Patients admitted to Shahid Bahonar Hospital in Kerman with chest injuries and requiring chest intubation during the study period in 1402 Age range between 18 and 65 years Be alert with GCS 15 The maximum injury severity score is 11. Non-penetrating injury with fracture of more than one rib

Exclusion criteria:

Unwillingness to participate in the study Decreased alertness Chronic obstructive pulmonary disease and asthma History of heart disease Venous obstruction Coagulation problems after abdominal and thoracic or brain and eye surgery

Age

From **18 years** old to **65 years** old

Gender

Both

Phase

N/A

Groups that have been masked

- Outcome assessor
- Data analyser
- Data and Safety Monitoring Board

Sample size

Target sample size: **64**

Actual sample size reached: **64**

Randomization (investigator's opinion)

Randomized

Randomization description

In this study, a restricted randomization method of block randomization with a ratio of 1:1 and a block size of four was used. Random allocation software version 2.0 was used to randomize the samples. In addition to simple randomization, this software was able to generate a random sequence using the block method, and as a result, this software was used for randomization simultaneously with blocking the samples. In order to maintain homogeneity of sample distribution and the frequency of chest injuries (penetrating and non-penetrating), the control and intervention groups included 18 patients with non-penetrating injuries and 14 patients with penetrating injuries to the chest.

Blinding (investigator's opinion)

Single blinded

Blinding description

In order to blind the study, a statistician independent of the study was responsible for the random assignment of participants to each of the two groups and the final analysis of the data. As a result, one-way blinding was utilized in this study.

Primary outcomes

1

Description

blood oxygen saturation

Timepoint

Before and after the three-day intervention (days one and three)

Method of measurement

ABG laboratory test

Secondary outcomes

1

Description

Hemothorax; pneumothorax; atelectasis; pneumonia

Timepoint

Third day after the intervention

Method of measurement

Spiral Chest CT-Scan

2

Description

Arterial pressure of O₂ (PaO₂)

Timepoint

Before and after the three-day intervention (days one and three)

Method of measurement

ABG laboratory test

3

Description

Arterial pressure of CO₂ (PaCO₂)

Timepoint

Before and after the three-day intervention (days one and three)

Method of measurement

ABG laboratory test

4

Description

Arterial blood pH

Timepoint

Before and after the three-day intervention (days one

and three)

Method of measurement

ABG laboratory test

5

Description

FVC

Timepoint

Before and after the three-day intervention (days one and three)

Method of measurement

Pulmonary function test

6

Title and more details about the data/document

All data from the study, study protocol, statistical analysis map, statistical analysis form, patient consent form, clinical study report, and codes used in data

analysis were used in the student thesis of Dr. Lotf Mohammadi and the published article at the end of the study, and will be visible on the website of the Department of General Surgery of Kerman University of Medical Sciences in the student theses section after 6 months from the publication of the article.

When the data will become available and for how long

The data access period begins 6 months after the results are published.

To whom data/document is available

The data will be accessible to the public after obtaining permission from the Vice Chancellor for Research and the Ethics Committee of Kerman University of Medical Sciences.

Under which criteria data/document could be used

The data will be available for use by other researchers for statistical analysis and use in other research after obtaining permission from the Vice President for Research and the Ethics Committee of Kerman University of Medical Sciences.

From where data/document is obtainable

To receive the data, an electronic letter should be sent to the Vice Chancellor for Research of the university, and after approval by the Vice Chancellor and the Ethics Committee, to the person in charge of the above research, Dr. Firoozeh Abolhasani, at the email address firoozeh1981@gmail.com, and the data request should be emailed along with the relevant permissions for the data request. People outside the country can contact the university's Vice President for Research by email.

What processes are involved for a request to access data/document

To receive the data, an electronic letter should be sent to the Vice Chancellor for Research of the university, and after approval by the Vice Chancellor and the Ethics Committee, to the person in charge of the above research, Dr. Firoozeh Abolhasani, at the email address firoozeh1981@gmail.com, and the data request should be emailed along with the relevant permissions for the data request. People outside the country can contact the university's Vice President for Research by email.
