Comparison of the effects of calcium and vitamin B1 on the severity of menstrual distress in 18-26 year old girls residing in dormitories

Protocol summary

Pain score, menstrual distress severity score, side effects

Study aim

To compare of the effect of calcium and vitamin B1 on the severity of menstrual distress

Design

A clinical trial with a control group and 2 experimental groups, with parallel groups, triple-blind, randomized, phase 3 on 123 patients, where Excel software was used for randomization.

Settings and conduct

In this triple-blind study, students living in dormitories of Torbat Heydariyeh University of Medical Sciences, in Iran assigned to 3 groups. Each person participated in the study for 4 cycles. The first cycle was to record the severity of menstrual pain and distress, 2 cycles of taking the drug or placebo, and the last cycle was to record the outcome.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Being Iranian; Being single; Being at most 28 years old; Having symptoms of menstrual distress for at least 3 cycles in the last 6 months; Having mild to moderate dysmenorrhea by Visual Analog Scale ($2 \leq \text{VAS} \leq 8$). Exclusion criteria: having symptoms of secondary dysmenorrhea; having a history of any chronic medical disease; use psychoactive drugs; having experience of using oral contraceptive pills in the previous 6 months; following a special diet.

Intervention groups

Intervention Group 1: Vitamin B1 Consumers: In this group, the research units will use a capsule containing 100 mg of thiamine hydrochloride, lactose, and microcrystalline cellulose daily for two months. Intervention Group 2: Calcium Consumers: In this group, the research units will use a capsule containing 600 mg of calcium carbonate daily for two months, as well as some lactose and microcrystalline cellulose as excipients. Control Group: In this group, the research units will use a placebo capsule containing some lactose and microcrystalline cellulose daily for two months.

Scientific title

Comparison of the effects of calcium and vitamin B1 on the severity of menstrual distress in 18-26 year old girls residing in dormitories

Public title

Effect of calcium and vitamin B1 on the severity of menstrual distress

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Being Iranian Being single Being at most 28 years old Having symptoms of menstrual distress for at least 3 cycles in the last 6 months Having mild to moderate dysmenorrhea by Visual Analog Scale ($2 \leq VAS \leq 8$) Having regular menstrual cycle Having a normal body mass index .

Exclusion criteria:

Having symptoms of secondary dysmenorrhea Having a history of any chronic medical disease Use psychoactive drugs Having experience of using oral contraceptive pills in the previous 6 months Following a special diet Using of tobacco or alcoholic beverages Being a professional athlete

Age

From **18 years** old to **26 years** old

Gender

Female

Actual sample size reached: **123**

Randomization (investigator's opinion)

Randomized

Randomization description

In this study, the research units were individually and randomly assigned to three groups: calcium consumers, vitamin B1 consumers, and control. After preparing a list of research units with inclusion criteria, Excel software was used for randomization, and the randomization was completely hidden and based on the number of research units. For this purpose, all research units that met the inclusion criteria were assigned a number, which, based on the expected required sample size, created a total numerical range between 1 and 150. Then, the RANDARRAY function in Excel was used to select random data without repetition in the three study groups.

Blinding (investigator's opinion)

Triple blinded

Blinding description

In order to blind the study, drugs were prepared as coded tablets. The second researcher distributed the

supplements without knowing the code of the tablets (60 tablets to each group for consumption in a period of 2 months) and the participants were unaware of the type of tablets consumed during the study. Also, data analysis was done blindly.

Dysmenorrhea, unspecified

Primary outcomes

1

Description

Severity of pain

Timepoint

One cycle before the intervention and one cycle after the intervention

Method of measurement

Visual Analog Scale

2

Description

Menstrual distress

Timepoint

One cycle before the intervention and one cycle after the intervention

Method of measurement

Moos Menstrual Distress Questionnaire

Secondary outcomes

empty

Intervention groups

1

Description

Control group: Research units in the control group will receive one placebo capsule containing lactose and microcrystalline cellulose daily for two months without the active ingredient in terms of calcium and vitamin B1. The capsules in the three groups were identical in color, shape, and size and were produced by the Industrial Pharmaceutical Laboratories of the Faculty of Pharmacy, Mashhad University of Medical Sciences.

Category

Placebo

2

Description

Intervention Group 1: Research units in this group will receive one capsule containing 100 mg of thiamine hydrochloride, lactose, and microcrystalline cellulose daily for two months.

Title and more details about the data/document

All data is potentially shareable after de-identifying individuals.

When the data will become available and for how long

Access period starts 6 months after results are published.

To whom data/document is available

Researchers working in academic and scientific institutions

Under which criteria data/document could be used

The data will be de-identified and usable for the purpose of developing knowledge.

From where data/document is obtainable

Documents can be received via email at Kabirianm1@gmail.com and Maryam Kabirian will be responsible.

What processes are involved for a request to access data/document

The request will be sent via email and will be available after a period of 1 week for coordination with other members of the research team and preparation of documentation.
