Comparing the effect of intensity and type of endurance exercise on airway epithelial integrity in healthy adult men

Protocol summary

Study aim

Comparing the effect of intensity and type of endurance exercise on airway epithelial integrity in healthy adult men

Design

A randomized, sealed-envelope, unblinded, community-based trial with 3 intervention groups and no control group on 30 samples.

Settings and conduct

20 minutes of endurance exercise (continuous endurance exercise with an intensity of 80 to 90% of maximum heart rate, continuous endurance exercise with an intensity of 65 to 75% of maximum heart rate, and intermittent endurance exercise with an intensity of 80 to 90% of maximum heart rate) on a treadmill in the Exercise Physiology Laboratory of the University of Tabriz, from 9 am to 12 pm and without blinding the groups.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Having a history of at least 1 exercise session per week; Exclusion criteria: having heart and lung diseases and smokers

Intervention groups

Intervention group: 30 healthy active men (3 groups of 10) who perform at least one and a maximum of 3 exercise sessions per week.

Main outcome variables

Serum levels of Clara cell protein, surfactant protein D, and the ratio of Clara cell protein to surfactant protein D in healthy, active men

Scientific title

Comparing the effect of intensity and type of endurance exercise on airway epithelial integrity in healthy adult men

Public title

The effect of aerobic endurance exercise on airway epithelial integrity in healthy adult men

Purpose

Education/Guidance

Inclusion/Exclusion criteria

Inclusion criteria:

Adult men between the ages of 18 and 30 Those who participate at least 1 and a maximum of 3 exercise sessions per week

Exclusion criteria:

prior history of specific diseases such as pulmonary and cardiovascular diseases prior history of tobacco smoking for at least six months prior to intervention prior history of using β 2-agonists and any anti-inflammatory medications or supplements

Age

From **18 years** old to **30 years** old

Gender

Male

Phase

Groups that have been masked

No information

Sample size

Target sample size: **30**

Randomization (investigator's opinion)

Randomized

Randomization description

Using stratified randomization, individuals were placed in two homogeneous groups (High-intensity endurance exercise group, moderate-intensity endurance exercise group, and interval endurance exercise group). Then random cluster randomization for each group was used. The randomization tool also sealed the envelope. The randomization unit was also individual. Individual numbers inside the pack identified the subjects of each group. And did not allocation concealment.

Blinding (investigator's opinion)

Not blinded

Health conditions studied

1

Description of health condition studied

Does not apply

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Serum levels of Clara cell protein in healthy, active men

Timepoint

Blood sampling before endurance exercise, 60 minutes and one day after endurance exercise

Method of measurement

Clara cell protein kit

2

Description

Serum levels of Surfactant D protein in healthy, active men

Timepoint

Blood sampling before endurance exercise, 60 minutes and one day after endurance exercise

Method of measurement

Surfactant D protein kit

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: 10 healthy active men who will perform 20 minutes of continuous endurance exercise at an intensity of 85-90 percent of maximum heart rate

Category

Other

2

Description

Intervention group: 10 healthy active men who will perform 20 minutes of interval endurance exercise at an intensity of 85-90 percent of maximum heart rate.

Category
