Comparison of Electromyographic Activity of Selected Shoulder Girdle Muscles Following a Core Muscle Fatigue Protocol in Overhead Athletes With and Without Scapular Dyskinesis

Protocol summary

Electrical activity of selected shoulder girdle muscles

Study aim

The aim of the study was to compare the electrical activity of selected shoulder girdle muscles under the influence of core muscle fatigue in athletes with and without scapular dyskinesis.

Design

A parallel clinical trial. Among athletes performing overhead movements, 15 of them with scapular dyskinesis and 15 of them without dyskinesis are randomly selected.

Settings and conduct

This study will be conducted in the corrective movement laboratory of Shahrekord University. After the examinations, the participants will be placed in the dyskinesia group and the healthy group during the evaluation process. Before the start of the study, all individuals will be examined for the desired outcomes and will be re-evaluated after the measurement is completed. In this study, all assessments will be made by the therapist.

Participants/Inclusion and exclusion criteria

Male gender - Positive or negative tests for scapular dyskinesis - Having an age range between 15 and 20 years - Having at least 3 years of sports experience in disciplines with overhead arm movements - Doing regular exercise three sessions per week - No history of injuries such as dislocations or fractures or surgery in any of the bones of the shoulder girdle - No complete rupture of the shoulder girdle muscles - No atrophy of the shoulder muscles - No pain during the tests and protocol

Intervention groups

This study will involve overhead athletes aged 18 to 25 with and without scapular dyskinesis, and the electrical activity of selected muscles (eight muscles) will be measured before and after core muscle fatigue.

Scientific title
Comparison of Electromyographic Activity of Selected Shoulder Girdle Muscles Following a Core Muscle Fatigue Protocol in Overhead Athletes With and Without Scapular Dyskinesis

Public title
Comparison of Electromyographic Activity of Selected Shoulder Girdle Muscles Following a Core Muscle Fatigue Protocol in Overhead Athletes With and Without Scapular Dyskinesis

Purpose
Health service research

Inclusion/Exclusion criteria

Inclusion criteria:

Being an overhead athlete Positive or negative results of scapular dyskinesis tests Having at least 3 years of sports experience Regular exercise sessions three times a week Voluntary consent of subjects to participate in the research

Exclusion criteria:

History of injuries, such as dislocations or fractures, to any shoulder girdle bones History of shoulder or trunk surgery within the past 1 year History of direct contact injury to the neck or upper limb within the past 1 month Complete rupture of shoulder girdle muscles Having adhesive capsulitis Any atrophy in the shoulder muscle area Presence of severe musculoskeletal disorders in the upper limbs including forward head, rounded shoulders, kyphosis, scoliosis Diagnosis of injury to the long thoracic nerve or accessory nerve Any pain during the tests and protocol

Age
From **18 years** old to **25 years** old
