Comparing the effect of cardiopulmonary resuscitation (CPR) training using media player and role-playing methods on the knowledge and self-efficacy of emergency medical and nursing students in Sarab

Protocol summary

Study aim
Comparing the effect of cardiopulmonary resuscitation training using the medial and role-playing methods on students' knowledge, performance, and self-efficacy.
Design
Two intervention groups as pre-test and post-test
Settings and conduct
In both groups, the intervention will be conducted in the form of role-playing and media player training. After the intervention, the level of knowledge and effectiveness will be measured.
Participants/Inclusion and exclusion criteria
Nursing students, semesters 7 and 8 and semester 5 of emergency medicine
Intervention groups
The first group of nursing students using the media player method. The second group of emergency medical students using the role-playing method.
Main outcome variables
Level of knowledge, awareness and efficiency of students

Scientific title
Comparing the effect of cardiopulmonary resuscitation (CPR) training using media player and role-playing methods on the knowledge and self-efficacy of emergency medical and nursing students in Sarab

Public title
The effect of cardiopulmonary resuscitation (CPR) training using media player and role-playing on students' knowledge and self-efficacy
Purpose
Education/Guidance
Inclusion/Exclusion criteria
Inclusion criteria:
Nursing students in their 7th and 8th semesters who

have completed theoretical and practical courses in cardiopulmonary resuscitation. Students in the 5th semester of emergency medicine who have completed theoretical and practical courses in cardiopulmonary resuscitation. Willingness to participate in the study.

Exclusion criteria:

• Failure to cooperate in participating in the study

Age

From **22 years** old to **28 years** old

Gender

Both

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **60**

More than 1 sample in each individual

Number of samples in each individual: **30**

In each group, one will be randomly selected from both genders.

Randomization (investigator's opinion)

Randomized

Randomization description

One class will be emergency students and the other class will be nursing students. Then, each class will be assigned to two groups (intervention) of media player and role playing by simple randomization method through a table of random numbers prepared or generated by Excel. Considering that the type of student (nursing/emergency) is an important variable in determining the outcome, assigning it to two separate classes and then randomly assigning them will eliminate the imbalance of the groups in terms of student type and will also allow for cross-disciplinary comparison.

Blinding (investigator's opinion)

Not blinded

Health conditions studied

1

Description of health condition studied

Investigating the level of knowledge, awareness, self-efficacy, and psychomotor performance of nursing and emergency medical students

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Examining the level of knowledge and awareness of nursing students and medical emergencies

Timepoint

At the beginning of the study, after the intervention, one month after the intervention

Method of measurement

The researcher-made questionnaire was developed by Aliari et al. (2016). At the beginning of the questionnaire, demographic information including age, gender, and marital status will be collected. The research questions include 21 four-choice questions regarding the knowledge test. The 30-question performance evaluation checklist questionnaire will be used as a post-test in two rounds.

2

Description

Examining the level of efficiency of nursing students and medical emergencies

Timepoint

At the beginning of the study, after the intervention, one month after the intervention

Method of measurement

The researcher-made questionnaire was developed by Aliari et al. (2016). At the beginning of the questionnaire, demographic information including age, gender, and marital status will be collected. The research questions include 21 four-choice questions regarding the knowledge test. The 30-question performance evaluation checklist questionnaire will be used as a post-test in two rounds.

3

Description

Examining the level of psychomotor skills of nursing and emergency medical students

Timepoint
At the beginning of the study, after the intervention, one month after the intervention

Method of measurement
The researcher-made questionnaire was developed by Aliari et al. (2016). At the beginning of the questionnaire, demographic information including age, gender, and marital status will be collected. The research questions include 21 four-choice questions regarding the knowledge test. The 30-question performance evaluation checklist questionnaire will be used as a post-test in two rounds.

Intervention groups

1

Description
Intervention group: Nursing students using the media player method: After explaining the study objectives to the students eligible for the study and obtaining written informed consent and ensuring their willingness to participate in the research, the samples will be divided into two nursing and emergency medical groups (to conduct a comparison after the intervention). Both training groups will undergo theoretical and practical training for 2 days, 8 hours each day. At the beginning of the study, participants in both groups will be given a pre-test on their level of knowledge about cardiopulmonary resuscitation. In the nursing students intervention group using the media player method and film screening, the topic of cardiopulmonary resuscitation will be taught to students during a 3-session day (6 hours), with a break between sessions. Theoretical content will include: a review of the anatomy and physiology of the heart and breathing, recognizing the symptoms of cardiopulmonary arrest, how to open the airway, give breaths, and establish blood circulation. The location of the film screening will be coordinated with the person in charge of classroom affairs at Sarab School of Nursing and Midwifery. After implementing the educational intervention, the questionnaire will be completed again by the instructors as a post-test immediately and one month after the intervention. In order to standardize the educational process in both groups, two fixed instructors (project facilitators) will be used.

Category
Behavior

2

Description
Intervention group: Emergency medical students will undergo a role-playing method: In the emergency training group, theoretical and practical training will be conducted. At the beginning of the study, participants from both groups will be given a pre-test on their level of awareness about cardiopulmonary resuscitation. Initially, the topic of cardiopulmonary resuscitation will be taught to students through a lecture method over a 3-session day (6 hours), with breaks between sessions. Theoretical content will include: a review of the anatomy and physiology of the heart and breathing, recognizing the symptoms of cardiopulmonary arrest, how to open the airway, give breaths, and establish blood circulation. And on the next day, a practical course will be conducted for students in 3 sessions (6 hours) on a mock-up and they will practice under the supervision of instructors. The theoretical class will be held in coordination with the class affairs officer at Sarab Nursing and Midwifery School, and the practical class will be held in the school's practice hall. After implementing the educational intervention, the questionnaire will be completed again by the trainers as a post-test immediately and one month after the intervention. In order to standardize the training process in both groups, two permanent trainers (project facilitators) will be used.
