Comparison of sensitivity and specificity of ultrasonography and plain radiographic image in diagnosis of shoulder dislocation reduction in Rasool akram haospital patients in 2014-2015

Protocol summary

Summary

Objectives: Comparison of sensitivity and specificity of ultrasonography and plain radiographic image in diagnosis of shoulder dislocation reduction. Design: The randomized clinical trial in the emergency department of Rasoul Akram hospital. Setting and conduct: Patients complaining shoulder pain and with probable diagnosis of shoulder dislocation admitted in Emergency Department of Rasoul Akram hospital will be recruited. Standard imagings including AP, Lateral, And Scapular Y views will be conducted to confirm the dislocation. After physical exam and imaging, and confirmation of the diagnosis of shoulder dislocation, the patients will be randomized to two groups and after reduction imaging in one group and sonographic exam in another group will be done to confirm the reduction. After confirmation of reduction, patients will be discharged from emergency department and will be evaluated with an orthopedist within 24 hour time. Participants including major eligibility criteria: Inclusion criteria: Complaint of shoulder pain and probable diagnosis of shoulder dislocation. Exclusion criteria: Patients younger than 18 years and older than 65 years old; Multiple Trauma patients; Patients with unstable hemodynamic. Interventions: Intervention Group: Patients in this group will be evaluated with sonography to confirm reduction. Control Group: Patients in this group will be evaluated with imaging to confirm reduction. Main outcome measures (variable): Confirmation of successful reduction.
