Comparison of the effect of eccentric and concentric biased exercises on foot posture and balance in individuals with flatfoot

Protocol summary

Study aim

The purpose of this study is comparing the effect of eccentric and concentric biased exercises on foot posture and balance in individuals with flatfoot

Design

A clinical trial with the control group, with parallel groups, randomized

Settings and conduct

First, the subjects will be selected based on the inclusion and exclusion criteria of the study, and after completing the personal information form and consent form, they will be divided into three groups: two experimental groups and a control group, all of whom have flexible flatfoot. First, a pre-test will be taken from all subjects, then the experimental groups will perform eccentric and concentric biased exercises, while the control group will only perform daily activities. The experimental groups will perform the exercises for 6 weeks, three days a week, each session for 20-40 minutes.

Participants/Inclusion and exclusion criteria

The inclusion criteria: being female, having a flexible flatfoot, having a navicular drop of more than 10 millimeters, and having a body mass index (BMI) between 18 and 25. The exclusion: a history of injury, fracture, or surgery in the lower extremities, non-participation in two consecutive training sessions, and engaging in activities outside the participants' training program.

Intervention groups

In eccentric biased exercises, the emphasis is on the eccentric phase, while in concentric exercises, the emphasis is on the concentric phase. The exercises used in this study included heel raises, the short foot exercise, and great toe (hallux) flexion.

Main outcome variables

Navicular Drop index, Y balance Test, Stork balance test

Scientific title

Comparison of the effect of eccentric and concentric biased exercises on foot posture and balance in individuals with flatfoot

Public title

Effectiveness of Eccentric and Concentric-Biased Exercises on flatfoot

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria:

Being in the age group of 11 to 15 years having a flexible flatfoot having a body mass index (BMI) between 18 and 25

Exclusion criteria:

Age

From **11 years** old to **15 years** old

Gender

Female

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **45**

Randomization (investigator's opinion)

Randomized

Randomization description

The simple randomization method, using sealed envelopes, is employed to assign participants to different groups. Each intervention type is written on a card and placed in a sealed envelope. Participants are listed in the order of their enrollment in the study. After each participant is enrolled, the envelopes are shuffled randomly, and each participant is asked to select one envelope at random. The number of envelopes is determined based on the expected sample size, ensuring that each selected envelope is not re-entered into the randomization process. This method ensures that the number of participants in each experimental group is approximately equal, thereby reducing the risk of discrepancies in group sizes.

Health conditions studied

1

Description of health condition studied

Flexible Flatfoot

ICD-10 code

Q66.5

ICD-10 code description

Congenital pes planus

Primary outcomes

1

Description

Navicular drop

Timepoint

Before the study starts and after 6 weeks of exercise intervention

Method of measurement

Navicular drop index

2

Description

Static balance

Timepoint

Before the study starts and after 6 weeks of exercise intervention

Method of measurement

Stork balance test

3

Description

Dynamic balance

Timepoint

Before the study starts and after 6 weeks of exercise intervention

Method of measurement

Y balance test

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: The eccentric/concentric-biased groups will perform the exercises for six weeks, three days per week, each lasting 20 to 40 minutes. A warm-up period of 5-10 minutes will be conducted before each session, followed by a 5-10-minute cool-down after the exercises. In eccentric-biased training, the emphasis will be on the eccentric phase of the exercises, whereas in concentric-biased training, the focus will be on the concentric phase. The exercises included in this study are heel raises, the short foot exercise, and great toe (hallux) flexion. The tempo for eccentric-biased exercises will be set at 2-0-4, while for concentric-biased exercises, it will be 4-0-2. Exercise progression will follow a structured sequence, starting from a seated position, advancing to a standing position with both feet and finally to a single-leg standing position.
