Iranian Registry of Clinical Trials

12 Jul 2026

Comparison the effect of Music therapy and Entonox inhalation for pain relief in labor in pregnant women reffer to the Shohada Tajrish hospital

Protocol summary

Summary

This randomized clinical trial is conducted to evaluate whether use of music or entonox gas could reduce labor pain. Between 2012 and 2013, a total of 150 women at 37 weeks or greater with spontaneous labor that have not conterandication of vaginal delivery are randomized to music, entonox gas and control groups. Fast music without words is played for M group. The mask of entonox is provided for E group. Routine cares are used for all groups. Labor pain was assessed on a visual analogue scale (VAS) at beginning of the active phase and then every 1 hour. Duration of active phase of labor will record.

Health conditions studied

1

Description of health condition studied
pain and duration of labor

ICD-10 code
O63

ICD-10 code description
long labour

Primary outcomes

1

Description
labor pain

Timepoint
at the beginning of active phase and then every 1 hour

Method of measurement
VAS Score

2

Description
duration of active phase

Timepoint
from beginning of active phase of labor to full dilatation of cervix

Method of measurement
minutes

Secondary outcomes

1

Description
maternal complications

Timepoint
at the end of the study

Method of measurement
history and physical examination

2

Description
fetal complications

Timepoint
at the end of the study

Method of measurement
physical examination

3

Description
cesarean rate

Timepoint
at the end of study

Method of measurement
hospital documents

4

Description
neonatal Apgar

Timepoint
first and fifth minutes

Method of measurement
Apgar score

Intervention groups

1

Description
entonox gas, in active phase of labor with uterin contractions

Category
Treatment - Drugs

2

Description
fast music therapy, in active phase of labor

Category

Treatment - Other

3

Description

standard cares
