Evaluation of Curcumin effect on plaque formation and plaque rupturing biomarkers in coronary artery disease

Protocol summary

Summary

Randomized double blind placebo control trial; phase 2. Inclusion criteria: age more than 18 and diagnosis of coronary artery disease according to angiography results. Exclusion criteria: severe renal or hepatic failure; having infectious disease; use of immunosuppressive or anti-inflammatory drugs; curcumin sensitivity; pregnancy and lactation. The main goal of study is the evaluation of Curcumin effect on plaque formation and plaque rupturing biomarkers in coronary artery disease. 40 patients with the diagnosis of coronary artery diseases according to angiography results will be selected. These patients with completion of inclusion and exclusion criteria will be randomly included in one of two groups (curcumin or placebo) and will be treated with Curcumin or placebo in addition to typical therapeutic regimen. Blood samples will be prepared before and 2 months after the beginning of study and then evaluated for the effect on atherosclerosis plaque formation and plaque instability. Biomarkers including: MCP-1, VCAM-1, MMP-9, IL-18, CD-40L, MPO.
