The Effect of High-Intensity Functional Training Combined with Terminalia chebula Supplementation on Nitric Oxide, C-Reactive Protein, Insulin Resistance, and Cardiometabolic Risk in Women with Metabolic Syndrome

Protocol summary

Study aim

The effect of high-intensity functional training combined with black cumin supplement on improving nitric oxide, C-reactive protein, insulin resistance, and cardiometabolic risk in women with metabolic syndrome.

Design

Simple random sampling was performed with a sample size of 60 women with metabolic syndrome using G Power software. The subjects were aged 35 to 45 and divided into 4 groups (supplement, exercise, control, supplement and exercise).

Settings and conduct

The subjects will be under research interventions for 8 weeks. Before and after 8 weeks, the desired factors will be measured to obtain results. The research will be conducted in Fars Province, Eghlid City, Rastegar Laboratory and Kargan Sports Hall.

Participants/Inclusion and exclusion criteria

The inclusion criteria for the present study were waist circumference greater than 88 cm, blood triglyceride level greater than 150 mg/dL, HDL level less than 50 mg/dL, systolic blood pressure greater than 130 mmHg or diastolic blood pressure greater than 85 mmHg, and blood glucose level greater than 100 mg/dL. Inactivity, non-smoking, and alcohol consumption were other inclusion criteria for the present study. Also, if the subjects have cardiovascular, respiratory, renal, or neurological disorders, they will not be allowed to enter the research.

Intervention groups

Terminalia chebula supplementation in two groups (supplement and exercise and supplement) High-intensity functional training (exercise, supplement and exercise)

Main outcome variables

on Nitric Oxide, C-Reactive Protein, Insulin Resistance, and Cardiometabolic Risk

Scientific title

The Effect of High-Intensity Functional Training Combined with Terminalia chebula Supplementation on Nitric Oxide, C-Reactive Protein, Insulin Resistance, and Cardiometabolic Risk in Women with Metabolic Syndrome

Public title

Investigating the effect of high-intensity functional training combined with Terminalia chebula supplementation in women with metabolic syndrome.

Purpose

Basic science

Inclusion/Exclusion criteria**Inclusion criteria:**

The inclusion criteria for the present study were waist circumference greater than 88 cm, blood triglyceride level greater than 150 mg/dL, HDL level less than 50 mg/dL, systolic blood pressure greater than 130 mmHg or diastolic blood pressure greater than 85 mmHg, and blood glucose level greater than 100 mg/dL. Failure to attend more than three training sessions, unwillingness to continue participating in the study, failure to take supplements regularly, and physical injury were exclusion criteria.

Exclusion criteria:

Subjects will not be included in the study if they have the following conditions: smoking and alcohol consumption, history of or suffering from any heart, lung, kidney, liver or neurological disease.

Age

From **35 years** old to **45 years** old

Gender

Female

Phase

2-3

Sample size

Target sample size: **60**

Randomization (investigator's opinion)

Randomized

Randomization description

Simple randomization. According to the call for volunteers to participate in the study (women with metabolic syndrome), blood tests and the desired factors were measured. We placed the people in 4 groups of 15 people without regard to specific criteria and with completely equal chances. (That is, the people in the exercise or supplemental exercise or mock or control group are no different from each other.)

Blinding (investigator's opinion)

Single blinded

Blinding description

those responsible for data collection, such as the nurse responsible for blood tests, do not know who is in the control, exercise, supplement, and supplement and exercise groups.

Placebo

Not used

Assignment

Factorial

Other design features

The current study includes exercise and herbal supplementation to improve metabolic health in people with metabolic syndrome.

Health conditions studied**1****Description of health condition studied**

Women with metabolic syndrome

ICD-10 code**ICD-10 code description****Primary outcomes****1****Description**

Nitric oxide, C-reactive protein, insulin resistance, and cardiometabolic risk are not balanced and optimal.

Timepoint

Measurements of all factors considered are measured on two days (the first day for blood factors and the second day for physical performance) before and after 8 weeks.

Method of measurement

Nitric oxide, C-reactive protein, and insulin resistance are measured with blood tests, and cardiometabolic risk is measured using blood pressure measurements, waist circumference to height, and the Cooper test to measure aerobic capacity.

Secondary outcomes

empty

Intervention groups

1

Description

Exercise group. Supplement group. Exercise and supplement group. Control group. Interventions are applied to the first three groups for 8 weeks. 3 training sessions per week and 500 mg supplement capsules are taken twice a day for 8 weeks.
