The Effect of SMS-Based Education on Mothers Sleep Knowledge and Sleep Quantity among Elementary School Students: A Single-Blind Randomized Clinical Trial

Protocol summary

Summary

This study is a clinical trial study that by cluster sampling will be selected primary schools for boys and girls. After completion of CSI-4 questionnaires by the mothers, children who are not psychotic problems are selected. At the beginning of the study to find out the children's sleep quantity, sleep registration of two-week (two week sleep record) will be completed by the mothers and After reviewing the results, Children who suffer with sleep deprivation isolated and randomly will be divided into control and intervention groups. To study the mothers sleep knowledge in both groups, parents-sleep knowledge inventory will be completed by mothers. Then in the intervention group a month to mothers sleep hygiene messages will be sent every day. Upon completion of the one month, two- week sleep record and parents-sleep knowledge inventory will be completed by mothers again. By comparing the two groups at the end the sleep quantity and sleep knowledge will be measured. To study the long-term behavior changes after three months, students will be examined again sleep quantity.
