Randomized-controlled trial on Electromagnetictherapy for treatment of insomnia

Protocol summary

Summary

This study, that was a random single blind clinical trial, was done on 60 people who have referred to the office of the neurologist and according to the DSM-IV criteria, their diagnosis has been determined. The samples were determined according to similar studies and random number distributions. They were placed in 2 groups of 30 people with electromagnetic and control (treatment with Alperazolam) and they were treated for 3 weeks. Using the questionnaire of studying the quality of sleep Pittsburgh(PSQI) also the questionnaire of the study of the severity of the insomnia (ISI) of the patients in 3 periods before the study and immediately after the treatment and 1 month after treatment were evaluated and the results were analyzed statistically.
