Added Value of Diaphragm Myofascial Release in Improving Pain, Function and Balance in Females With Patellofemoral Pain A Randomized Clinical Trial

Protocol summary

Study aim

To investigate the added value of diaphragm myofascial release in improving pain, function, and balance in females with patellofemoral pain.

Design

A controlled, double group, single blinded (assessor), randomized (Randomizer site), phase 3 clinical trial on 20 patients.

Settings and conduct

The study at Shiraz's School of Rehabilitation Sciences will investigate the effect of diaphragm release on pain, intensity, balance and function of patients with patellofemoral pain. Manual techniques are applied once per week for four weeks, alongside therapeutic exercises for 2 groups. Blinding of evaluator is maintained by separating treatment and assessment roles.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Females aged 18-35 with unilateral patellofemoral pain, anterior or retropatellar pain during at least two activities of squatting, kneeling, stair ascent or descent, prolonged sitting with knee flexed, running, or jumping, tenderness at the lateral patellar facet, anterior surface of the medial or lateral femoral condyle. Pain at least 3 on the Numeric Rating Scale (NRS). The Kujala score less than 85, positive patellar apprehension test, informed consent. Exclusion criteria: History of knee surgery, trauma, pathologies, patellar dislocation, active inflammatory conditions affecting lower limb, neurological, systemic musculoskeletal and metabolic disorders, affected gait, marked structural deformity, pathological condition of back, hip, and ankle, respiratory, cardiovascular or metabolic disorders, professional athletes, received physiotherapy or structured exercises in the past 6 months, pregnancy, menstrual phase at assessment time, body Mass Index (BMI) > 30.

Intervention groups

The intervention group receives myofascial diaphragmatic release therapy and exercise therapy. The control group only receives exercise therapy.

Main outcome variables

Pain, function, balance

Scientific title

Added Value of Diaphragm Myofascial Release in Improving Pain, Function and Balance in Females With Patellofemoral Pain A Randomized Clinical Trial

Public title

Added Value of Diaphragm Myofascial Release in Improving Pain, Function and Balance in Females With Patellofemoral Pain

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Diagnosis of unilateral PFP by a qualified physician or physiotherapist Females between 18 and 30 years Presence of anterior or retro patellar knee pain during at least two of the following activities: squatting, kneeling, ascending/descending stairs, prolonged sitting with flexed knee, running, jumping pain on palpation of the medial or lateral patellar facet, or the anterior aspect of the medial or lateral femoral condyle. Duration of symptoms for more than 8 weeks Pain intensity of ≥ 3 on the NRS (numerical rating scale) during the week before assessment scoring less than 10 out of 100 on the Kujala anterior knee pain scale (AKPS) positive patellar apprehension test (sensitivity: 86.7%, specificity: 86.7%) Willingness to participate and provide informed consent

Exclusion criteria:

History of knee surgery, trauma, or patellar dislocation Evidence of other knee pathologies (e.g., meniscal tear, ligament injury, or osteoarthritis) Active inflammatory conditions affecting the lower limb Neurological, systemic musculoskeletal and metabolic disorders (e.g., multiple sclerosis, rheumatoid arthritis and diabetes respectively) History of fracture, dislocation or surgery of lower limb or any condition affecting gait Marked structural deformity and known pathological condition of back, hip, and ankle Respiratory disorders that could influence diaphragm function (e.g., COPD, asthma) Cardiovascular disorders metabolic disorders Professional athlete (an individual who regularly participates in a specific sport at least three times per week for a minimum of two hours) Participation in other physiotherapy treatments or structured exercise programs in the past 6 months Pregnancy the patient should not be in the menstrual phase at the time of assessment Body Mass Index (BMI) > 30

Age

Sample size

Target sample size: 20

Randomization (investigator's opinion)

Randomized

Randomization description

Participants will be randomly assigned into two groups using block randomization with a block size of six

Blinding (investigator's opinion)

Single blinded

Blinding description

It is important to note that the examiners will be blinded to the randomization process, which will be carried out by an independent individual. Moreover, evaluation and intervention procedures will be conducted by two separate physiotherapists to minimize bias.

Patellofemoral disorders

Primary outcomes

1

Description

Pain intensity

Timepoint

Before intervention; One day after intervention period

Method of measurement

Numerical pain rating scale

2

Description

Physical function

Timepoint

Before intervention; One day after intervention period

Method of measurement

The Kujala Anterior Knee Pain Scale (KANPS)

3

Description

Dynamic balance

Timepoint

Before intervention; One day after intervention period

Method of measurement

Modified star excursion test

Secondary outcomes

empty

Intervention groups

1

Description

Intervention Group: Diaphragmatic Myofascial Release and Exercise Therapy. Participants in the intervention group received diaphragmatic myofascial release combined with therapeutic exercises. For diaphragmatic release, the patient was positioned in supine. The therapist stood at the head of the table and placed bilateral manual contact beneath the lower costal cartilages (ribs 5-10) using the hypothenar eminence and the last three fingers of both hands. During inspiration, gentle traction was applied in a cephalad and slightly lateral direction while simultaneously facilitating rib elevation. During expiration, the therapist gradually deepened the manual contact toward the inner costal margins, following tissue relaxation. Each session of diaphragmatic release lasted approximately 5 minutes.
