Investigating the Impact of Essential Newborn Care Guidelines on Breastfeeding Indicators and Neonatal Outcomes: A Randomized Controlled Trial

Protocol summary

Study aim
Determining the impact of the Essential Early Neonatal Care Guide on breastfeeding indicators and neonatal outcomes

Design
Randomized controlled trial with control group and parallel groups. Randomization with colored cards

Settings and conduct
Pregnant women who referes to Nohe Dey hospital of torbat heydariyeh city for vaginal delivery, if were eligible, include in the study and by using colored cards, randomly assign to intervention and control groups.

Participants/Inclusion and exclusion criteria
Inclusion criteria: Willingness to participate in the study, Maternal age between 18-45 years, Gestational age 42-37 weeks, Vaginal delivery, Singleton pregnancy. Exclusion criteria: Mothers with medical and obstetric disorders, Mothers with contraindications to breastfeeding, Mothers with no intention of breastfeeding, Mothers with flat or inverted nipples

Intervention groups
Intervention group: a series of interventions for the infant began at birth and continued for 90 minutes after birth or until the first successful breastfeeding was completed on the mother's abdomen and chest. These included keeping the infant warm and dry, initiating early and continuous skin-to-skin contact, clamping and cutting the umbilical cord after the umbilical artery pulse had stopped, and guiding the mother to initiate the first breastfeeding as soon as she saw early signs of hunger. The control group also received routine hospital care.

Main outcome variables
Duration of first successful breastfeeding; infant behavior during first breastfeeding; breastfeeding self-efficacy; exclusive breastfeeding; time of lactogenesis II.

Scientific title
Investigating the Impact of Essential Newborn Care Guidelines on Breastfeeding Indicators and Neonatal Outcomes: A Randomized Controlled Trial

Public title
Investigating the Impact of Newborn Care Guidelines on Breastfeeding Indicators

Purpose
Supportive

Inclusion/Exclusion criteria

Inclusion criteria:
Willingness to participate in the study Mother's age between 18 and 45 years Gestational age 37 – 42 weeks Vaginal delivery Singleton pregnancy

Exclusion criteria:
Mothers with medical and obstetric disorders Mothers with contraindications to breastfeeding Mothers without intention to breastfeeding Mothers with flat or inverted nipples

Age
From **18 years** old to **45 years** old

Gender
Female

Phase
N/A

Groups that have been masked
No information

Sample size
Target sample size: **70**

Randomization (investigator's opinion)
Randomized

Randomization description
In this study, a random assignment method using colored cards will be used to divide the research units into two groups: intervention and control. For this purpose, green cards (representing the intervention group) and red cards (representing the control group) will be prepared in equal numbers according to the final sample size and placed in dark, sealed, and opaque envelopes. After each mother meets the entry requirements for the study and obtains informed consent, an envelope will be randomly selected by one of the research assistants who is not involved in the grouping process. The color of the card inside the envelope will determine which group (intervention or control) the research unit will be placed in. This method will continue until the sample size is completed in both groups to ensure a random and balanced distribution of participants in the two groups.

Blinding (investigator's opinion)
Not blinded

Health conditions studied

1

Description of health condition studied
Breastfeeding Indicators

ICD-10 code

ICD-10 code description

2

Description of health condition studied
Neonatal Outcomes

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description
Baby's behavior at the beginning of breastfeeding

Timepoint
During the first breastfeeding after birth during the intervention

Method of measurement
Infant Breastfeeding Assessment Tool

2

Description
Breastfeeding self-efficacy

Timepoint
At the time of discharge after the intervention

Method of measurement
Breastfeeding Self-Efficacy Scale-Short Form

3

Description
Lactogenesis 2

Timepoint
The first time research units feel fullness and firmness in the breasts after giving birth after the intervention
Method of measurement
Lactogenesis 2 Assessment Checklist

4

Description
Exclusive breastfeeding
Timepoint
At the time of discharge after the intervention
Method of measurement
Exclusive breastfeeding assessment checklist

Secondary outcomes

1

Description
Neonatal temperature
Timepoint
At 15, 30, 45, 60, 75, 90, 105 and 120 minutes after birth
Method of measurement
mercury thermometer

2

Description
Neonatal arterial oxygen saturation
Timepoint
At 15, 30, 45, 60, 75, 90, 105 and 120 minutes after birth
Method of measurement
Pulse oximeter device

3

Description
Neonatal's heartbeat
Timepoint
At 15, 30, 45, 60, 75, 90, 105 and 120 minutes after birth
Method of measurement
Pulse oximeter device

Intervention groups

1

Description
Intervention group: A set of interventions initiated at the time of birth in accordance with WHO guidelines and continued for up to 90 minutes after birth or until the completion of the first successful breastfeeding on the mother’s abdomen and chest. These interventions include immediate drying and warming of the newborn on the mother’s abdomen, early and continuous skin-to-skin contact for 90 minutes or until the end of the first successful breastfeeding through the breast crawl method, clamping and cutting of the umbilical cord after cessation of pulsation in the umbilical artery, and guiding the mother to initiate the first breastfeeding via the breast crawl method upon observing early hunger cues.
Category
Prevention

2

Description
Control group: Routine ward care, including early clamping of the umbilical cord, skin-to-skin contact for 10 minutes, drying and warming of the newborn under a radiant warmer, and initiation of the first breastfeeding using the conventional method after completion of the third stage of labor and repair of episiotomy and/or any perineal lacerations.
