

Clinical Trial Protocol

Iranian Registry of Clinical Trials

29 Jul 2026

Comparison efficacy of intra operative ultrasound during the laparoscopy cholecystectomyin reduce the bile ducts injury.

Protocol summary

Summary

The purpose of this study is showing that intra operative ultrasound during the laparoscopy cholecystectomy prepare a better visualization for surgeon and since obesity and intestinal gas, don't make restrictions on the diagnosis therefor, it can show a better anatomic view to surgeon. We study patients who are candidate for cholecystectomy. The exclusion criterion includes the patients whose laparoscopy are converts to laparotomy. The sample size for this study is 150 patients. The participants are divided into two groups randomly. Intra operative ultrasound is done just in one group and the intraoperative complication such as bile duct injury will be assessed in both groups. Intra operative Sonography can reduce the risk of intra operative billiary tract injury.

Primary outcomes

1

Description

Bile duct injury

Timepoint

intraoperative, two days after operation

Method of measurement

clinical signs and surgeon's diagnosis

Secondary outcomes

1

Description

Finding Bile duct stone

Timepoint

intraoperative

Method of measurement

inspection in Sonography

Intervention groups

1

Description

In the intervention group, for the patients, during laparoscopic surgery ultrasound is done.

Category

Prevention

2

Description

In the intervention group, for the patients during laparoscopic ultrasound is not done.
