The effect of adding dual task to functional training on proprioception, range of motion, pain, and kinesiophobia in people with chronic non-specific low back pain

Protocol summary

Study aim

Investigating the effect of adding dual task to functional exercises on proprioception, range of motion, pain, and fear of movement in people with chronic nonspecific low back pain

Design

The sample size of the study was estimated using G*Power software. Calculations were made based on a statistical power of 0.8, a significance level of $\alpha = 0.05$, and a medium effect size of 0.25, and the final sample size increased to 45 people.

Settings and conduct

Dezful City Energy Plus Club.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Diagnosis of chronic non-specific low back pain by a specialist Pain duration ≥ 3 months Age range 25-60 years Pain intensity 3-7 on the Numeric Pain Rating Scale (NPRS) Body mass index (BMI) < 30 kg/m² Exclusion criteria: History of spinal surgery Regular exercise for back pain in the past 6 months Use of analgesic, anti-inflammatory, opioid, or immunosuppressive medications Movement, mental, cognitive, hearing, visual, or communication disabilities (preventing full protocol implementation) History of spinal trauma or fracture, cancer, severe osteoporosis, neurodegenerative diseases (such as Parkinson's), or illiteracy

Intervention groups

Experimental group 1: (Single-task exercise): Performed the exercise protocol without additional cognitive task.
Experimental group 2: (Dual exercise + exercise protocol): Performed the basic low back pain exercise protocol with simultaneous cognitive task (dual task).
Control group: A passive intervention.

Main outcome variables

lumbar proprioception, lumbar range of motion, pain intensity, fear of movement.

Scientific title

The effect of adding dual task to functional training on proprioception, range of motion, pain, and kinesiophobia in people with chronic non-specific low back pain

Public title

The effect of adding dual task to functional training on proprioception, range of motion, pain, and kinesiophobia in people with chronic non-specific low back pain

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Diagnosis of chronic non-specific low back pain by a specialist physician
Duration of pain ≥ 3 months
Age range 25 to 60 years
Self-reported pain intensity 3 to 7 using the Numeric Pain Rating Scale (NPRS)
Body mass index (BMI) less than 30 kg/m²

Exclusion criteria:

History of spinal surgery
Having a regular exercise program related to back pain exercises in the past 6 months
Undergoing treatment for pain or taking analgesic, anti-inflammatory, opioid or immunosuppressive drugs
If they have a motor, mental or cognitive disability, or hearing, vision or communication disorders that prevent them from completing the protocol, they will be excluded from the study
Individuals with a history of spinal trauma or fracture, cancer, (severe osteoporosis, spondyloarthropathy, spondylolisthesis, systemic inflammatory disease, illiteracy, diagnosed neurodegenerative diseases (such as Parkinson's) will be excluded from the study

Age

From 25 years old to 60 years old

Gender

Both

Phase

Sample size

Target sample size: 45

Randomization (investigator's opinion)

Randomized

Randomization description

This study is a three-group randomized clinical trial with a pretest-posttest design and randomized control groups in the form of a randomized clinical trial (RCT). Eligible participants will be randomly divided into the following three groups: Experimental Group 1: (Single-task exercise): Perform the exercise protocol without additional cognitive task. Experimental Group 2: (Dual exercise + exercise protocol): Perform the basic low back pain exercise protocol with a simultaneous cognitive task (dual task). Control group: An inactive intervention.

Blinding (investigator's opinion)

Single blinded

Blinding description

This study is a **single-blind randomized controlled clinical trial**. The study follows a **pretest-posttest design** with two intervention groups and one control group. In this study, the outcome assessor will be blinded to group allocation.

Health conditions studied

1

Description of health condition studied

chronic non-specific low back pain

ICD-10 code

M54.5

ICD-10 code description

Low back pain

Primary outcomes

1

Description

Back proprioception

Timepoint

Outcome variables are measured at two time points: before and after the fatigue protocol.

Method of measurement

Lumbar proprioception is assessed using a hand-held goniometer and the method of Newcomer et al. (2000). The subject, standing with eyes closed, recreates a 30-degree angle of lumbar flexion in three attempts. The mean absolute error of the three repetitions in degrees is

recorded as the reconstruction error score, with higher scores indicating poorer proprioception.

Secondary outcomes

1

Description

Lumbar range of motion

Timepoint

Outcome variables are measured at two time points: before and after the protocol.

Method of measurement

The range of motion of lumbar flexion and extension is measured using the modified Schober test. After marking reference points on the spine, the subject is asked to bend forward and backward as much as possible. The distance between the two points is measured with a tape measure, and the average of the three repetitions is recorded as the final score.

2

Description

Pain

Timepoint

Outcome variables are measured at two time points: before and after the protocol.

Method of measurement

Pain intensity is measured using a visual analog scale (VAS) consisting of a 10-cm horizontal line with two ends, "no pain" (score 0) and "worst possible pain" (score 10). The subject is asked to mark a point on the line and the distance from the zero point is recorded as the pain score. This assessment will be performed at pre-test and post-test.

3

Description

kinesiophobia

Timepoint

Outcome variables are measured at two time points: before and after the protocol.

Method of measurement

kinesiophobia is measured using the Tampa Scale (TSK) consisting of 17 questions on a 4-point Likert scale (1 to 4). The range of scores varies from 17 to 68, with higher scores indicating greater fear of movement. A score of 37 or less is interpreted as low fear and a score above 37 as high fear of movement.

Intervention groups

1

Description

Intervention group:(Single-task training): Performing the training protocol without additional cognitive task

Category

Rehabilitation

2

Description

Intervention group: (Dual exercise + training protocol): Performing a basic back pain training protocol along with a simultaneous cognitive task (dual task).

Category

Rehabilitation

3

Description

Control group: No exercise intervention.
