The effect of electroacupressure on motor function and muscular power of pelagic upper extremity in patient with stroke

Protocol summary

Summary

Objectives: Determine the effect of electroacupressure on muscular motor function and power of pelagic upper extremity in patient with stroke. **Design:** Double blind clinical trial. **Setting and conduct:** The intervention is performed in three groups includes routine care, use of electroacupressure, and placebo. Electroacupressure is applied by wristbands with a metal button attached to the active electrode of TENS devices, on the P6 (Neiguan) point in internal surface of forearm and above internal groove of wrist. When the wristband button is placed on the opposite side of the P6 (Neiguan) point, it is the role of the placebo. Routine treatment includes physiotherapy routine in internal ward and ICU. **Participants:** Inclusion criteria are: (1) being over 35 years old; (2) upper extremity paralysis due to stroke; (3) having no other musculoskeletal disorders on the upper extremity; (4) patients with cognitive status so that they could have cooperated; (5) having no skin problem such as allergies and ulcers at the wristband site; (6) Physiotherapy is started for them; (7) maximum a week is passed their stroke; (8) having no recurrent stroke; (9) the patient is not received thrombolytic drugs; (10) having no stroke in the area of cerebellum and brain stem; (11) having no rearsible ischemic neurologic deficit (RIND). Exclusion criteria are: (1) patients with cardiac pacemakers; (2) patients with sensory aphasia; (3) patients with a history of narcotics addiction. **Intervention:** Interventions including routine care, use of electroacupressure, and placebo that are done in three groups. Main outcome measures (variables): motor function and muscular power of pelagic upper extremity.

Scientific title

The effect of electroacupressure on motor function and muscular power of pelagic upper extremity in patient

with stroke

Public title

The effect of electroacupressure on motor function and muscular power of pelagic upper extremity in patient with stroke

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria: (1) being over 35 years old; (2) Upper extremity paralysis due to stroke; (3) No other musculoskeletal disorders on the upper limb; (4) Patients with cognitive status so that they could have cooperated; (5) having no skin problem such as allergies and ulcers at the wrist strap site; (6) physiotherapy should be started for them; (7) maximum a week passed they strokes; (8) no recurrent stroke; (9) the patient did not receive thrombolytic drugs; (10) not in cerebellum and brain stem stroke; (11) is not reversible ischemic neurologic deficit (RIND). Exclusion criteria: (1) Patients with cardiac pacemakers; (2) Patients with sensory aphasia; (3) Patients with a history of drug addiction.

Age

From **35 years** old to **90 years** old

Gender

Both

Phase

2-3

Stroke

Primary outcomes

1

Description

Motor function of pelagic upper extremity

Timepoint

Before start intervention at the first session and after the intervention at the last session

Method of measurement

Part of evaluation of upper limb motor function and Hand of Fugl Meyer scale

Secondary outcomes

1

Description

Muscular power of pelagic upper extremity

Timepoint

Before start intervention at the first session and After the intervention, at the last session

Method of measurement

By manually dynamometer

Intervention groups

1

Description

First intervention (Routine care): In the control group patients receive routine care, after the doctor's orders to start physiotherapy, routine physiotherapy is performed for all patients. motor function and muscular power of pelagic upper extremity are measured by researcher before start intervention at the first session and after the intervention at the last session by using Fugl Meyer checklist and manually dynamometer.

Category

Other

2

Description

The second intervention (use of electroacupressure): In the intervention group, to applying the electroacupressure, the wristbands is closed on patients' wrists so that its button is placed on the P6 point (Nei guan) on the inner surface of the forearm, about 2 inches (three fingers width) above the internal groove of wrist. Pressure is applied so that the patient does not feel pain or discomfort. Electrical stimulation is applied with wave length 200 μ s, frequency 20Hz, and intensity 2.5 times the threshold of patient sense by a metal button attached to the active electrode of TENS devices on the P6 (Neiguan) point. The intervention is performed for 10 minutes immediately after physiotherapy, five days per week and during two consecutive weeks. Motor function and muscular power of pelagic upper extremity are measured by researcher before start intervention at the first session and after the intervention at the last session by using Fugl Meyer checklist and manually dynamometer.

Category

Rehabilitation

3

Description

The third intervention (use of placebo): In the intervention group using placebo, wristbands is closed on patients' wrists so that its button is placed on opposite of P6 point (Nei guan) on the back of the forearm. Active electrode (positive) of TENS device is connected to the metal buttons, device is turned on but does not give electrical stimulation. The intervention is performed for 10 minutes immediately after physiotherapy, five days per week and during two consecutive weeks. Motor function and muscular power of pelagic upper extremity are measured by researcher before start intervention at the first session and after the intervention at the last session by using Fugl Meyer checklist and manually dynamometer.
