Effect of topical finasteride on treatment of patients with androgenic alopecia

Protocol summary

Summary

Our aim in this study is to evaluate the impact of topical finasteride on the treatment of androgenic alopecia. In a randomized, non-blinded, unicentral clinical trial, 58 patients from both genders with androgenic alopecia referring to the dermatology clinics of Sina hospital, Tabriz, Iran, will be evaluated. The key inclusion criteria is to have androgenic alopecia and key exclusion criteria are to be pregnant; to have non-androgenic alopecia in other regions of the body. All of the patients would be treated with topical finasteride solution for a 12-month period once a day. Type of androgenic alopecia, number of lost hair obtained from a hair loss test and mean hair diameter will be measured before and 3, 6, 9 and 12 months after the initiation of the treatment. Obtained values will be recorded and evaluated.

Health conditions studied

1

Description of health condition studied

Androgenic alopecia

ICD-10 code

L64

ICD-10 code description

Androgenic alopecia

Primary outcomes

1

Description

Number of lost hair

Timepoint

Before the initiation of the treatment and 3, 6, 9 and 12 month after the initiation of the treatment

Method of measurement

Using hair loss test

2

Description

Hair diameter

Timepoint

Before the initiation of the treatment and 3, 6, 9 and 12 month after the initiation of the treatment

Method of measurement

Using a micrometer under a microscope

3

Description

Type of androgenic alopecia

Timepoint

Before the initiation of the treatment and 3, 6, 9 and 12 month after the initiation of the treatment

Method of measurement

Based on protocol

Secondary outcomes

empty

Intervention groups

1

Description

Administration of topical finasteride 2% solution for all the patients for a 12-month period to be used on the skulp skin with hair loss once each night.
