Comparison between therapeutic effects of methylphenidate with risperidone in methamphetamine dependent patients

Protocol summary

2012-04-16, 1391/01/28

Summary

In this experimental study 60 methamphetamine-dependent patients admitted to addiction clinics or psychiatric clinics in the city was selected after completing an informed consent to participate in the study by the patient or guardian him, Randomized to two groups: standard treatment (risperidone) and intervention (methylphenidate) are divided. Inclusion criteria: Methamphetamine dependence (More than 10 times the regular use of methamphetamine or 10 days); Positive Methamphetamine urine test; Age 18-65; no dependency to other opioid and opium; Exclusion criteria: seizure; tardive dyskinesia or tic; gravidity; past history of methylphenidate craving; past history of diabetes or MI; In the first and last study completed questionnaires contained demographic information and past history and physical exam and psychological exam. This information contains patient and sleep and daily activity and psychoic reaction and craving. The patients divided into two groups (standard treatment and intervention). Standard group give risperidone 1mg during 1 week, then 1mg/bid during 3 week. Intervention group give methylphenidate 10mg/day during 2 week, then 7.5 mg/day during 1 week, then 5 mg/day during 1 week. Both groups information is calculated then therapeutic effect comparison is analysed.
