The effect of early post cesarean feeding on wound healing

Protocol summary

Summary

Background and purpose: wound complication is a main problem after cesarean section. Insufficient nutrition delay wound healing because decrease saved energy of body and provide conditions of infection. If nutrition be enough and suitable, body receive most of material and wound healing happen soon. There are a few papers about this problem and they have reported different results. So the aim of this paper was to detect: The effect of early post cesarean feeding on wound healing. Materials and Methods: This study was a controlled trial. The research population was women delivered by cesarean section in Ommolbanin hospital, Mashhad, Iran. The samples consist of 82 women randomly assigned in two groups of study and control. The study group started oral fluids 4 hours after surgery, followed by regular diet after return of bowel sounds. The control group started oral fluids 12 hours after surgery then oral solid food was allowed after defecation. The groups were compared about wound healing after 10 days by Reeda scale.

Health conditions studied

1

Description of health condition studied
cesarean
ICD-10 code
O86.0
ICD-10 code description
Infection of obstetric surgical wound

2

Description of health condition studied
cesarean
ICD-10 code
O25
ICD-10 code description
Malnutrition in pregnancy

Primary outcomes

1

Description
Cesarean wound healing
Timepoint
ten days after cesarean
Method of measurement
Reeda scale

Secondary outcomes

empty

Intervention groups

1

Description
The study group started oral fluids 4 hours after surgery, followed by regular diet after return of bowel sounds.
Category
Prevention

2

Description
The control group started oral fluids 12 hours after surgery then oral solid food was allowed after defecation.
