Randomized clinical trial comparing surgical and aesthetic outcomes following endoscopic-assisted tissue neck expansion and open approach in reconstruction of major facial burn injuries

Protocol summary

Summary

Objective: Recently endoscopy has shown promises in reconstructive surgeries using tissue expander placement. This study aims to compare outcomes between open and endoscopic-assisted neck tissue expander placement in reconstruction of post-burn facial scar deformity. Design: Through a randomized clinical trial, patients with facial burn scar were assigned to either open group and endoscopic group undergoing placement of tissue expanders. Setting and conduct: Department of Plastic and Reconstructive Surgery, Saint Fatima Hospital, Iran University of Medical Sciences, Tehran, Iran Participants including major eligibility criteria: Patients with major facial burn injuries requiring tissue expansion reconstruction will be included. Patients with immunocompromised status, extending burn to the neck region and inability to participate will be excluded. Intervention: Tissue expanders are placed in neck through endoscopic approach in Intervention group and through open technique in Control group main outcome measures variable: Complication rate, operative time, length of hospital stay and time to full expansion

Scientific title

Randomized clinical trial comparing surgical and aesthetic outcomes following endoscopic-assisted tissue neck expansion and open approach in reconstruction of major facial burn injuries

Public title

Reconstruction of major extensive facial burn injuries

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion Criteria: Major facial burn injuries requiring

tissue expansion reconstruction Exclusion Criteria:
Immuno-compromised status; extending burn to the neck
region; inability to participate in the study

Age

No age limit

Gender

Both

Phase

2-3

Groups that have been masked

No information

Sample size

Target sample size: 60

Examination and History Taking

Intervention groups

1

Description

Intervention group Using an endoscopic approach, tissue expanders are placed in neck pocket tissue and connected to a port far away at the port site. Following achievement of full expansion of neck tissue, flaps are removed from expansion site and used for reconstruction of facial burn.

Category

Treatment - Surgery

2

Description

Control group In this group, the traditional open approach is used to insert tissue expander and connected to the port near its location. After full expansion, tissues are removed and transferred to cover the facial burn scar deformities.

Category

Treatment - Surgery
