

Clinical Trial Protocol

Iranian Registry of Clinical Trials

16 Sep 2026

Comparison the efficacy of music therapy on decreasing aggression in blind students before and after clinical trial

Protocol summary

Summary

Objectives: Nowadays one of the social harms is aggression especially during the adolescent age. The present study will be done to evaluate the effect of music therapy on reducing the aggression and aggressive behavior in blind students. Material and Method: This research is a quasi-experimental study with pre- and post-study compared with control group. The participants are high school blind students studying in 2012-2013 school year in Bojnord, Iran. All blind students will be entered and no exclusion criteria would be considered for this study. The studied individuals are divided into two equal group as intervention and control group. For intervention group, the music therapy sessions will be conducted during 12 sessions that each will be lasted ninety minutes. Boss and Pery questionnaire and Rutter's test (the teacher version) are used for measuring the aggression variable before and after the study for both intervention and control groups.
