Entonox take effect on the duration of the active phase of labor and delivery in pregnant women who referred to Ahvaz Imam Khomeini hospital for termination of pregnancy

Protocol summary

Summary

This clinical trial was performed on 200 pregnant women who were referred for termination of pregnancy to delivery. In study group, Entonox gas was used in delivery. In control group delivery was done without anaesthesia. Mothers from the beginning of the active phase of the study came to study. Pregnant women with systemic disease - women who had narcotics within eight hours - multiple pregnancies - a non-cephalic presentation - head and pelvic disproportion - Poly Ahyghydramnys - meconium - fetal distress and ... and those who had complications during labor and induction of labor or cesarean delivery were excluded from the study were required. During the active phase of the second stage of labor and the newborn Apgar score were measured. Entonox adverse events per hour of labor pain and delivery phase and were asked to decrease. Maternal satisfaction was assessed at the end of the delivery.
